

公众号「Python七号」回复「速查表」获取精美 pdf 版本。

通常情况下使用 **Ctrl+F / ⌘ + F** 来检索就足够了，点击 Contents 中的主题可以跳转。

Contents

1. Collections: **List, Dictionary, Set, Tuple, Range, Enumerate, Iterator, Generator.**
2. Types: **Type, String, Regular_Exp, Format, Numbers, Combinatorics, Datetime.**
3. Syntax: **Args, Inline, Imports, Decorator, Class, Duck_Type, Enum, Exception.**
4. System: **Exit, Print, Input, Command_Line_Arguments, Open, Path, OS_Commands.**
5. Data: **JSON, Pickle, CSV, SQLite, Bytes, Struct, Array, Memory_View, Deque.**
6. Advanced: **Threading, Operator, Introspection, Metaprograming, Eval, Coroutines.**
7. Libraries: **Progress_Bar, Plot, Table, Curses, Logging, Scraping, Web, Profile, NumPy, Image, Audio, Games, Data.**

Main

```
if __name__ == '__main__':    # Runs main() if file wasn't imported.
    main()
```

List

```
<list> = <list>[<slice>]      # Or: <list>[from_inclusive : to_exclusive
: ±step]
```

```
<list>.append(<el>)           # Or: <list> += [<el>]
<list>.extend(<collection>)    # Or: <list> += <collection>
```

```
<list>.sort()                  # Sorts in ascending order.
<list>.reverse()               # Reverses the list in-place.
<list> = sorted(<collection>)   # Returns a new sorted list.
<iter> = reversed(<list>)      # Returns reversed iterator.
```

```
sum_of_elements    = sum(<collection>)
elementwise_sum    = [sum(pair) for pair in zip(list_a, list_b)]
sorted_by_second   = sorted(<collection>, key=lambda el: el[1])
sorted_by_both     = sorted(<collection>, key=lambda el: (el[1], el[0]))
flatter_list       = list(itertools.chain.from_iterable(<list>))
product_of_elems   = functools.reduce(lambda out, el: out * el,
<collection>)
list_of_chars      = list(<str>)
```

- For details about `sorted()`, `min()` and `max()` see [sortable](#).
- Module [operator](#) provides functions `itemgetter()` and `mul()` that offer the same functionality as [lambda](#) expressions above.

```
<list>.insert(<int>, <el>)      # Inserts item at index and moves the rest
to the right.
<el> = <list>.pop([<int>])      # Returns and removes item at index or from
the end.
<int> = <list>.count(<el>)      # Returns number of occurrences. Also works
on strings.
<int> = <list>.index(<el>)      # Returns index of the first occurrence or
raises ValueError.
<list>.remove(<el>)            # Removes first occurrence of the item or
raises ValueError.
<list>.clear()                 # Removes all items. Also works on
dictionary and set.
```

Dictionary

```
<view> = <dict>.keys()          # Coll. of keys that
reflects changes.
<view> = <dict>.values()        # Coll. of values that
reflects changes.
<view> = <dict>.items()         # Coll. of key-value
tuples that reflects chgs.
```

```
value = <dict>.get(key, default=None) # Returns default if key
is missing.
value = <dict>.setdefault(key, default=None) # Returns and writes
default if key is missing.
<dict> = collections.defaultdict(<type>) # Creates a dict with
default value of type.
<dict> = collections.defaultdict(lambda: 1) # Creates a dict with
default value 1.
```

```
<dict> = dict(<collection>)      # Creates a dict from
coll. of key-value pairs.
<dict> = dict(zip(keys, values)) # Creates a dict from two
collections.
<dict> = dict.fromkeys(keys [, value]) # Creates a dict from
collection of keys.
```

```

<dict>.update(<dict>)                # Adds items. Replaces
ones with matching keys.
value = <dict>.pop(key)               # Removes item or raises
KeyError.
{k for k, v in <dict>.items() if v == value} # Returns set of keys that
point to the value.
{k: v for k, v in <dict>.items() if k in keys} # Returns a dictionary,
filtered by keys.

```

Counter

```

>>> from collections import Counter
>>> colors = ['blue', 'blue', 'blue', 'red', 'red']
>>> counter = Counter(colors)
>>> counter['yellow'] += 1
Counter({'blue': 3, 'red': 2, 'yellow': 1})
>>> counter.most_common()[0]
('blue', 3)

```

Set

```

<set> = set()

```

```

<set>.add(<el>)                        # Or: <set> |= {<el>}
<set>.update(<collection> [, ...])    # Or: <set> |= <set>

```

```

<set> = <set>.union(<coll.>)            # Or: <set> | <set>
<set> = <set>.intersection(<coll.>)     # Or: <set> & <set>
<set> = <set>.difference(<coll.>)       # Or: <set> - <set>
<set> = <set>.symmetric_difference(<coll.>) # Or: <set> ^ <set>
<bool> = <set>.issubset(<coll.>)        # Or: <set> <= <set>
<bool> = <set>.issuperset(<coll.>)      # Or: <set> >= <set>

```

```

<el> = <set>.pop()                    # Raises KeyError if
empty.
<set>.remove(<el>)                    # Raises KeyError if
missing.
<set>.discard(<el>)                   # Doesn't raise an error.

```

Frozen Set

- Is immutable and hashable.
- That means it can be used as a key in a dictionary or as an element in a set.

```
<frozenset> = frozenset(<collection>)
```

Tuple

Tuple is an immutable and hashable list.

```
<tuple> = ()
<tuple> = (<el>,)           # Or: <el>,
<tuple> = (<el_1>, <el_2> [, ...])  # Or: <el_1>, <el_2> [, ...]
```

Named Tuple

Tuple's subclass with named elements.

```
>>> from collections import namedtuple
>>> Point = namedtuple('Point', 'x y')
>>> p = Point(1, y=2)
Point(x=1, y=2)
>>> p[0]
1
>>> p.x
1
>>> getattr(p, 'y')
2
>>> p._fields  # Or: Point._fields
('x', 'y')
```

Range

```
<range> = range(to_exclusive)
<range> = range(from_inclusive, to_exclusive)
<range> = range(from_inclusive, to_exclusive, ±step_size)
```

```
from_inclusive = <range>.start
to_exclusive   = <range>.stop
```

Enumerate

```
for i, el in enumerate(<collection> [, i_start]):  
    ...
```

Iterator

```
<iter> = iter(<collection>)           # `iter(<iter>)` returns  
unmodified iterator.  
<iter> = iter(<function>, to_exclusive) # A sequence of return values  
until 'to_exclusive'.  
<el>   = next(<iter> [, default])      # Raises StopIteration or  
returns 'default' on end.  
<list> = list(<iter>)                 # Returns a list of iterator's  
remaining elements.
```

Itertools

```
from itertools import count, repeat, cycle, chain, islice
```

```
<iter> = count(start=0, step=1)        # Returns updated value  
endlessly. Accepts floats.  
<iter> = repeat(<el> [, times])        # Returns element endlessly or  
'times' times.  
<iter> = cycle(<collection>)           # Repeats the sequence  
endlessly.
```

```
<iter> = chain(<coll_1>, <coll_2> [, ...]) # Empties collections in  
order.  
<iter> = chain.from_iterable(<collection>) # Empties collections inside a  
collection in order.
```

```
<iter> = islice(<coll>, to_exclusive)   # Only returns first  
'to_exclusive' elements.  
<iter> = islice(<coll>, from_inclusive, ...) # `to_exclusive, step_size`.
```

Generator

- Any function that contains a yield statement returns a generator.
- Generators and iterators are interchangeable.

```
def count(start, step):  
    while True:  
        yield start  
        start += step
```

```
>>> counter = count(10, 2)  
>>> next(counter), next(counter), next(counter)  
(10, 12, 14)
```

Type

- Everything is an object.
- Every object has a type.
- Type and class are synonymous.

```
<type> = type(<el>)                                # Or: <el>.__class__  
<bool> = isinstance(<el>, <type>)                  # Or: isinstance(type(<el>),  
<type>)
```

```
>>> type('a'), 'a'.__class__, str  
(<class 'str'>, <class 'str'>, <class 'str'>)
```

Some types do not have built-in names, so they must be imported:

```
from types import FunctionType, MethodType, LambdaType, GeneratorType,  
ModuleType
```

Abstract Base Classes

Each abstract base class specifies a set of virtual subclasses. These classes are then recognized by `isinstance()` and `issubclass()` as subclasses of the ABC, although they are really not. ABC can also manually decide whether or not a specific class is its virtual subclass, usually based on which methods the class has implemented. For instance, Iterable ABC looks for method `iter()` while Collection ABC looks for methods `iter()`, `contains()` and `len()`.

```
>>> from collections.abc import Sequence, Collection, Iterable  
>>> isinstance([1, 2, 3], Iterable)  
True
```

	Sequence	Collection	Iterable
list, range, str	yes	yes	yes
dict, set		yes	yes
iter			yes

```
>>> from numbers import Integral, Rational, Real, Complex, Number
>>> isinstance(123, Number)
True
```

	Integral	Rational	Real	Complex	Number
int	yes	yes	yes	yes	yes
fractions.Fraction		yes	yes	yes	yes
float			yes	yes	yes
complex				yes	yes
decimal.Decimal					yes

String

```
<str> = <str>.strip() # Strips all whitespace
characters from both ends.
<str> = <str>.strip('<chars>') # Strips all passed
characters from both ends.
```

```
<list> = <str>.split() # Splits on one or more
whitespace characters.
<list> = <str>.split(sep=None, maxsplit=-1) # Splits on 'sep' str at most
'maxsplit' times.
<list> = <str>.splitlines(keepends=False) # On [\n\r\f\v\x1c-
\x1e\x85\u2028\u2029] and \r\n.
```

```
<str> = <str>.join(<coll_of_strings>) # Joins elements using string
as a separator.
```

```
<bool> = <sub_str> in <str> # Checks if string contains a
substring.
<bool> = <str>.startswith(<sub_str>) # Pass tuple of strings for
multiple options.
<bool> = <str>.endswith(<sub_str>) # Pass tuple of strings for
multiple options.
<int> = <str>.find(<sub_str>) # Returns start index of the
first match or -1.
<int> = <str>.index(<sub_str>) # Same but raises ValueError
if missing.
```

```
<str> = <str>.replace(old, new [, count]) # Replaces 'old' with 'new'
at most 'count' times.
<str> = <str>.translate(<table>) # Use `str.maketrans(<dict>)`
to generate table.
```

```
<str> = chr(<int>) # Converts int to Unicode
character.
<int> = ord(<str>) # Converts Unicode character
to int.
```

- Also: **'lstrip()'**, **'rstrip()'** and **'rsplit()'**.
- Also: **'lower()'**, **'upper()'**, **'capitalize()'** and **'title()'**.

Property Methods

	[!#\$%...]	[a-zA-Z]	$\begin{smallmatrix} 1 & 1 & 3 \\ 4 & 2 & 4 \end{smallmatrix}$	$\begin{smallmatrix} 2 & 3 & 1 \end{smallmatrix}$	[0-9]
isprintable()	yes	yes	yes	yes	yes
isalnum()		yes	yes	yes	yes
isnumeric()			yes	yes	yes
isdigit()				yes	yes
isdecimal()					yes

- Also: **'isspace()'** checks for **'[\t\n\r\f\v\x1c-\x1f\x85...]'**.

Regex

```

import re
<str>    = re.sub(<regex>, new, text, count=0) # Substitutes all
occurrences with 'new'.
<list>   = re.findall(<regex>, text)           # Returns all occurrences
as strings.
<list>   = re.split(<regex>, text, maxsplit=0) # Use brackets in regex to
include the matches.
<Match>  = re.search(<regex>, text)           # Searches for first
occurrence of the pattern.
<Match>  = re.match(<regex>, text)            # Searches only at the
beginning of the text.
<iter>   = re.finditer(<regex>, text)         # Returns all occurrences
as match objects.

```

- **Search()** and **match()** return **None** if they can't find a match.
- Argument **'flags=re.IGNORECASE'** can be used with all functions.
- Argument **'flags=re.MULTILINE'** makes **'^'** and **'\$'** match the start/end of each line.
- Argument **'flags=re.DOTALL'** makes dot also accept the **'\n'**.
- Use **r'\1'** or **'\1'** for backreference.
- Add **'?'** after an operator to make it non-greedy.

Match Object

```

<str>    = <Match>.group()                    # Returns the whole match.
Also group(0).
<str>    = <Match>.group(1)                    # Returns part in the first
bracket.
<tuple>  = <Match>.groups()                    # Returns all bracketed
parts.
<int>    = <Match>.start()                     # Returns start index of
the match.
<int>    = <Match>.end()                       # Returns exclusive end
index of the match.

```

Special Sequences

- By default, decimal characters, alphanumerics and whitespaces from all alphabets are matched unless **'flags=re.ASCII'** argument is used.
- As shown below, it restricts special sequence matches to the first 128 characters and prevents **'\s'** from accepting **'[\x1c-\x1f]'** (the so-called separator characters).
- Use a capital letter for negation.

```

'\d' == '[0-9]'                               # Matches decimal
characters.
'\w' == '[a-zA-Z0-9_]'                         # Matches alphanumerics and
underscore.
'\s' == '[\t\n\r\f\v]'                       # Matches whitespaces.

```

Format

```
<str> = f'{{<el_1>}, {{<el_2>}}'
<str> = '{{}, {{}}'.format(<el_1>, <el_2>)
```

Attributes

```
>>> from collections import namedtuple
>>> Person = namedtuple('Person', 'name height')
>>> person = Person('Jean-Luc', 187)
>>> f'{{person.height}}'
'187'
>>> '{{p.height}}'.format(p=person)
'187'
```

General Options

{{<el>:<10}}	# '<el> '
{{<el>:^10}}	# ' <el> '
{{<el>:>10}}	# ' <el>'
{{<el>:.<10}}	# '<el>.....'
{{<el>:0}}	# '<el>'

- Options can be generated dynamically: `f'{{<el>:{{<str/int>}}[...]]}'`.
- Adding `'!r'` before the colon converts object to string by calling its `repr()` method.

Strings

{{'abcde':10}}	# 'abcde '
{{'abcde':10.3}}	# 'abc '
{{'abcde':.3}}	# 'abc '
{{'abcde'!r:10}}	# "'abcde' "

Numbers

{{123456:10}}	# ' 123456'
{{123456:10,}}	# ' 123,456'
{{123456:10_}}	# ' 123_456'
{{123456:+10}}	# ' +123456'
{{123456:=+10}}	# '+ 123456'

```
{123456: }           # ' 123456'
{-123456: }          # '-123456'
```

Floats

```
{1.23456:10.3}       # '      1.23'
{1.23456:10.3f}       # '      1.235'
{1.23456:10.3e}       # ' 1.235e+00'
{1.23456:10.3%}       # ' 123.456%'
```

Comparison of presentation types:

-----+
-----+

- When both rounding up and rounding down are possible, the one that returns result with even last digit is chosen. That makes `'{6.5:.0f}'` a '6' and `'{7.5:.0f}'` an '8'.

Ints

```
{90:c}          # 'Z'
{90:b}          # '1011010'
{90:X}          # '5A'
```

Numbers

Types

```
<int>      = int(<float/str/bool>)      # Or: math.floor(<float>)
<float>    = float(<int/str/bool>)      # Or: <real>e±<int>
<complex>  = complex(real=0, imag=0)    # Or: <real> ± <real>j
<Fraction> = fractions.Fraction(0, 1)    # Or: Fraction(numerator=0,
denominator=1)
<Decimal>  = decimal.Decimal(<str/int>) # Or: Decimal((sign, digits,
exponent))
```

- `'int(<str>)'` and `'float(<str>)'` raise `ValueError` on malformed strings.
- Decimal numbers can be represented exactly, unlike floats where `'1.1 + 2.2 != 3.3'`.
- Precision of decimal operations is set with: `'decimal.getcontext().prec = <int>'`.

Basic Functions

```
<num> = pow(<num>, <num>)      # Or: <num> ** <num>
<num> = abs(<num>)             # <float> = abs(<complex>)
<num> = round(<num> [, ±ndigits]) # `round(126, -1) == 130`
```

Math

```
from math import e, pi, inf, nan, isinf, isnan
from math import sin, cos, tan, asin, acos, atan, degrees, radians
from math import log, log10, log2
```

Statistics

```
from statistics import mean, median, variance, stdev, pvariance, pstdev
```

Random

```
from random import random, randint, choice, shuffle, gauss, seed

<float> = random()                # A float inside [0, 1).
<int>    = randint(from_inc, to_inc) # An int inside [from_inc,
to_inc].
<el>     = choice(<list>)          # Keeps the list intact.
```

Bin, Hex

```
<int> = ±0b<bin>                # Or: ±0x<hex>
<int> = int('±<bin>', 2)         # Or: int('±<hex>', 16)
<int> = int('±0b<bin>', 0)       # Or: int('±0x<hex>', 0)
<str> = bin(<int>)                # Returns '[-]0b<bin>'.
```

Bitwise Operators

```
<int> = <int> & <int>             # And: `0b1100 & 0b1010 ==
0b1000`.
<int> = <int> | <int>             # Or: `0b1100 | 0b1010 ==
0b1110`.
<int> = <int> ^ <int>             # Xor: `0b1100 ^ 0b1010 ==
0b0110`.
<int> = <int> << n_bits           # Left shift (>> for right)
<int> = ~<int>                   # Not (also: -<int> - 1)
```

Combinatorics

- Every function returns an iterator.
- If you want to print the iterator, you need to pass it to the list() function first!

```
from itertools import product, combinations,
combinations_with_replacement, permutations
```

```
>>> product([0, 1], repeat=3)
[(0, 0, 0), (0, 0, 1), (0, 1, 0), (0, 1, 1), ..., (1, 1, 1)]
```

```
>>> product('abc', 'abc')
[('a', 'a'), ('a', 'b'), ('a', 'c'),
 ('b', 'a'), ('b', 'b'), ('b', 'c'),
 ('c', 'a'), ('c', 'b'), ('c', 'c')]
#   a  b  c
# a x  x  x
# b x  x  x
# c x  x  x
```

```
>>> combinations('abc', 2)
[('a', 'b'), ('a', 'c'),
 ('b', 'c')]
#   a  b  c
# a .  x  x
# b .  .  x
```

```
>>> combinations_with_replacement('abc', 2)
[('a', 'a'), ('a', 'b'), ('a', 'c'),
 ('b', 'b'), ('b', 'c'),
 ('c', 'c')]
#   a  b  c
# a x  x  x
# b .  x  x
# c .  .  x
```

```
>>> permutations('abc', 2)
[('a', 'b'), ('a', 'c'),
 ('b', 'a'), ('b', 'c'),
 ('c', 'a'), ('c', 'b')]
#   a  b  c
# a .  x  x
# b x  .  x
# c x  x  .
```

Datetime

- Module 'datetime' provides 'date' <D>, 'time' <T>, 'datetime' <DT> and 'timedelta' <TD> classes. All are immutable and hashable.
- Time and datetime objects can be 'aware' <a>, meaning they have defined timezone, or 'naive' <n>, meaning they don't.
- If object is naive, it is presumed to be in the system's timezone.

```
from datetime import date, time, datetime, timedelta
from dateutil.tz import UTC, tzlocal, gettz, datetime_exists,
resolve_imaginary
```

Constructors

```
<D> = date(year, month, day)
<T> = time(hour=0, minute=0, second=0, microsecond=0, tzinfo=None,
fold=0)
<DT> = datetime(year, month, day, hour=0, minute=0, second=0, ...)
<TD> = timedelta(weeks=0, days=0, hours=0, minutes=0, seconds=0, ...)
```

- Use '`<D/DT>.weekday()`' to get the day of the week (Mon == 0).
- '`fold=1`' means the second pass in case of time jumping back for one hour.
- TD converts and normalizes args to \pm days, seconds (< 86400) and microseconds (< 1M).

Now

```
<D/DTn> = D/DT.today() # Current local date or naive
datetime.
<DTn> = DT.utcnow() # Naive datetime from current
UTC time.
<DTa> = DT.now(<tzinfo>) # Aware datetime from current
tz time.
```

- To extract time use '`<DTn>.time()`', '`<DTa>.time()`' or '`<DTa>.timetz()`'.

Timezone

```
<tzinfo> = UTC # UTC timezone. London without
DST.
<tzinfo> = tzlocal() # Local timezone. Also
gettz().
<tzinfo> = gettz('<Continent>/<City>') # 'Continent/City_Name'
timezone or None.
<DTa> = <DT>.astimezone(<tzinfo>) # Datetime, converted to the
passed timezone.
<Ta/DTa> = <T/DT>.replace(tzinfo=<tzinfo>) # Unconverted object with a
new timezone.
```

Encode

```
<D/T/DT> = D/T/DT.fromisoformat('<iso>') # Object from ISO string.
Raises ValueError.
<DT> = DT.strptime(<str>, '<format>') # Datetime from str, according
to format.
<D/DTn> = D/DT.fromordinal(<int>) # D/DTn from days since the
Gregorian NYE 1.
<DTn> = DT.fromtimestamp(<real>) # Local time DTn from seconds
```

```

since the Epoch.
<DTa>    = DT.fromtimestamp(<real>, <tz.>) # Aware datetime from seconds
since the Epoch.

```

- ISO strings come in following forms: **'YYYY-MM-DD'**, **'HH:MM:SS.ffffff[±<offset>]'**, or both separated by an arbitrary character. Offset is formatted as: **'HH:MM'**.
- Epoch on Unix systems is: **'1970-01-01 00:00 UTC'**, **'1970-01-01 01:00 CET'**, ...

Decode

```

<str>     = <D/T/DT>.isoformat(sep='T')           # Also
timespec='auto/hours/minutes/seconds'.
<str>     = <D/T/DT>.strftime('<format>')         # Custom string
representation.
<int>     = <D/DT>.toordinal()                     # Days since Gregorian NYE 1,
ignoring time and tz.
<float>   = <DTn>.timestamp()                     # Seconds since the Epoch,
from DTn in local tz.
<float>   = <DTa>.timestamp()                     # Seconds since the Epoch,
from DTa.

```

Format

```

>>> dt = datetime.strptime('2015-05-14 23:39:00.00 +0200', '%Y-%m-%d
%H:%M:%S.%f %Z')
>>> dt.strftime("%A, %dth of %B '%y, %I:%M%p %Z")
"Thursday, 14th of May '15, 11:39PM UTC+02:00"

```

- **'%Z'** only accepts **'UTC/GMT'** and local timezone's code. **'%z'** also accepts **'±HH:MM'**.
- For abbreviated weekday and month use **'%a'** and **'%b'**.

Arithmetics

```

<D/DT>    = <D/DT> ± <TD>                        # Returned datetime can fall
into missing hour.
<TD>      = <D/DTn> - <D/DTn>                    # Returns the difference,
ignoring time jumps.
<TD>      = <DTa> - <DTa>                        # Ignores time jumps if they
share tzinfo object.
<TD>      = <TD> * <real>                        # Also: <TD> = abs(<TD>) and
<TD> = <TD> ±% <TD>
<float>   = <TD> / <TD>                          # How many weeks/years there
are in TD. Also '//'.

```

Arguments

Inside Function Call

```
<function>(<positional_args>)           # f(0, 0)
<function>(<keyword_args>)               # f(x=0, y=0)
<function>(<positional_args>, <keyword_args>) # f(0, y=0)
```

Inside Function Definition

```
def f(<nondefault_args>):                # def f(x, y):
def f(<default_args>):                   # def f(x=0, y=0):
def f(<nondefault_args>, <default_args>): # def f(x, y=0):
```

Splat Operator

Inside Function Call

Splat expands a collection into positional arguments, while splatty-splat expands a dictionary into keyword arguments.

```
args    = (1, 2)
kwargs  = {'x': 3, 'y': 4, 'z': 5}
func(*args, **kwargs)
```

Is the same as:

```
func(1, 2, x=3, y=4, z=5)
```

Inside Function Definition

Splat combines zero or more positional arguments into a tuple, while splatty-splat combines zero or more keyword arguments into a dictionary.

```
def add(*a):
    return sum(a)
```

```
>>> add(1, 2, 3)
6
```

Legal argument combinations:

```
def f(x, y, z):          # f(x=1, y=2, z=3) | f(1, y=2, z=3) | f(1,
2, z=3) | f(1, 2, 3)
def f(*, x, y, z):       # f(x=1, y=2, z=3)
def f(x, *, y, z):       # f(x=1, y=2, z=3) | f(1, y=2, z=3)
def f(x, y, *, z):       # f(x=1, y=2, z=3) | f(1, y=2, z=3) | f(1,
2, z=3)
```

```
def f(*args):            # f(1, 2, 3)
def f(x, *args):         # f(1, 2, 3)
def f(*args, z):         # f(1, 2, z=3)
def f(x, *args, z):      # f(1, 2, z=3)
```

```
def f(**kwargs):         # f(x=1, y=2, z=3)
def f(x, **kwargs):      # f(x=1, y=2, z=3) | f(1, y=2, z=3)
def f(*, x, **kwargs):   # f(x=1, y=2, z=3)
```

```
def f(*args, **kwargs):  # f(x=1, y=2, z=3) | f(1, y=2, z=3) | f(1,
2, z=3) | f(1, 2, 3)
def f(x, *args, **kwargs): # f(x=1, y=2, z=3) | f(1, y=2, z=3) | f(1,
2, z=3) | f(1, 2, 3)
def f(*args, y, **kwargs): # f(x=1, y=2, z=3) | f(1, y=2, z=3)
def f(x, *args, z, **kwargs): # f(x=1, y=2, z=3) | f(1, y=2, z=3) | f(1,
2, z=3)
```

Other Uses

```
<list>  = [<collection> [, ...]]
<set>    = {<collection> [, ...]}
<tuple> = (<collection>, [...])
<dict>   = {**<dict> [, ...]}
```

```
head, *body, tail = <collection>
```

Inline

Lambda

```
<func> = lambda: <return_value>
<func> = lambda <arg_1>, <arg_2>: <return_value>
```

Comprehensions

```
<list> = [i+1 for i in range(10)]           # [1, 2, ..., 10]
<set> = {i for i in range(10) if i > 5}     # {6, 7, 8, 9}
<iter> = (i+5 for i in range(10))          # (5, 6, ..., 14)
<dict> = {i: i*2 for i in range(10)}       # {0: 0, 1: 2, ..., 9: 18}
```

```
>>> [l+r for l in 'abc' for r in 'abc']
['aa', 'ab', 'ac', ..., 'cc']
```

Map, Filter, Reduce

```
<iter> = map(lambda x: x + 1, range(10))    # (1, 2, ..., 10)
<iter> = filter(lambda x: x > 5, range(10)) # (6, 7, 8, 9)
<obj> = reduce(lambda out, x: out + x, range(10)) # 45
```

- Reduce must be imported from the functools module.

Any, All

```
<bool> = any(<collection>)                 # Is `bool(el)` True for any element.
<bool> = all(<collection>)                 # Is True for all elements or empty.
```

Conditional Expression

```
<obj> = <exp_if_true> if <condition> else <exp_if_false>
```

```
>>> [a if a else 'zero' for a in (0, 1, 2, 3)]
['zero', 1, 2, 3]
```

Named Tuple, Enum, Dataclass

```
from collections import namedtuple
Point = namedtuple('Point', 'x y')
point = Point(0, 0)
```

```
from enum import Enum
Direction = Enum('Direction', 'n e s w')
direction = Direction.n
```

```
from dataclasses import make_dataclass
Creature = make_dataclass('Creature', ['loc', 'dir'])
creature = Creature(point, direction)
```

Imports

```
import <module>           # Imports a built-in or '<module>.py'.
import <package>          # Imports a built-in or
'<package>/__init__.py'.
import <package>.<module> # Imports a built-in or
'<package>/<module>.py'.
```

- **Package is a collection of modules, but it can also define its own objects.**
- **On a filesystem this corresponds to a directory of Python files with an optional init script.**
- **Running '`import <package>`' does not automatically provide access to the package's modules unless they are explicitly imported in its init script.**

Closure

We have/get a closure in Python when:

- **A nested function references a value of its enclosing function and then**
- **the enclosing function returns the nested function.**

```
def get_multiplier(a):
    def out(b):
        return a * b
    return out
```

```
>>> multiply_by_3 = get_multiplier(3)
>>> multiply_by_3(10)
30
```

- If multiple nested functions within enclosing function reference the same value, that value gets shared.
- To dynamically access function's first free variable use '`<function>.__closure__[0].cell_contents`'.

Partial

```
from functools import partial
<function> = partial(<function> [, <arg_1>, <arg_2>, ...])
```

```
>>> import operator as op
>>> multiply_by_3 = partial(op.mul, 3)
>>> multiply_by_3(10)
30
```

- Partial is also useful in cases when function needs to be passed as an argument because it enables us to set its arguments beforehand.
- A few examples being: '`defaultdict(<function>)`', '`iter(<function>, to_exclusive)`' and dataclass's '`field(default_factory=<function>)`'.

Non-Local

If variable is being assigned to anywhere in the scope, it is regarded as a local variable, unless it is declared as a 'global' or a 'nonlocal'.

```
def get_counter():
    i = 0
    def out():
        nonlocal i
        i += 1
        return i
    return out
```

```
>>> counter = get_counter()
>>> counter(), counter(), counter()
(1, 2, 3)
```

Decorator

- A decorator takes a function, adds some functionality and returns it.
- It can be any **callable**, but is usually implemented as a function that returns a **closure**.

```
@decorator_name
def function_that_gets_passed_to_decorator():
    ...
```

Debugger Example

Decorator that prints function's name every time it gets called.

```
from functools import wraps

def debug(func):
    @wraps(func)
    def out(*args, **kwargs):
        print(func.__name__)
        return func(*args, **kwargs)
    return out

@debug
def add(x, y):
    return x + y
```

- Wraps is a helper decorator that copies the metadata of the passed function (func) to the function it is wrapping (out).
- Without it 'add.__name__' would return 'out'.

LRU Cache

Decorator that caches function's return values. All function's arguments must be hashable.

```
from functools import lru_cache

@lru_cache(maxsize=None)
def fib(n):
    return n if n < 2 else fib(n-2) + fib(n-1)
```

- CPython interpreter limits recursion depth to 1000 by default. To increase it use 'sys.setrecursionlimit(<depth>)'.

Parametrized Decorator

A decorator that accepts arguments and returns a normal decorator that accepts a function.

```

from functools import wraps

def debug(print_result=False):
    def decorator(func):
        @wraps(func)
        def out(*args, **kwargs):
            result = func(*args, **kwargs)
            print(func.__name__, result if print_result else '')
            return result
        return out
    return decorator

@debug(print_result=True)
def add(x, y):
    return x + y

```

Class

```

class <name>:
    def __init__(self, a):
        self.a = a
    def __repr__(self):
        class_name = self.__class__.__name__
        return f'{class_name}({self.a!r})'
    def __str__(self):
        return str(self.a)

    @classmethod
    def get_class_name(cls):
        return cls.__name__

```

- Return value of repr() should be unambiguous and of str() readable.
- If only repr() is defined, it will also be used for str().

Str() use cases:

```

print(<el>)
print(f'{<el>}')
raise Exception(<el>)
csv.writer(<file>).writerow([<el>])
logging.warning(<el>)

```

Repr() use cases:

```
print(<el>)\nprint(f'{{<el>!r}}')\n>>> <el>\nZ = dataclasses.make_dataclass('Z', ['a']); print(Z(<el>))
```

Constructor Overloading

```
class <name>:\n    def __init__(self, a=None):\n        self.a = a
```

Inheritance

```
class Person:\n    def __init__(self, name, age):\n        self.name = name\n        self.age = age\n\nclass Employee(Person):\n    def __init__(self, name, age, staff_num):\n        super().__init__(name, age)\n        self.staff_num = staff_num
```

Multiple Inheritance

```
class A: pass\nclass B: pass\nclass C(A, B): pass
```

MRO determines the order in which parent classes are traversed when searching for a method:

```
>>> C.mro()\n[<class 'C'>, <class 'A'>, <class 'B'>, <class 'object'>]
```

Property

Pythonic way of implementing getters and setters.

```
class MyClass:\n    @property\n    def a(self):
```

```

        return self._a

    @a.setter
    def a(self, value):
        self._a = value

```

```

>>> obj = MyClass()
>>> obj.a = 123
>>> obj.a
123

```

Dataclass

Decorator that automatically generates `init()`, `repr()` and `eq()` special methods.

```

from dataclasses import dataclass, field

@dataclass(order=False, frozen=False)
class <class_name>:
    <attr_name_1>: <type>
    <attr_name_2>: <type> = <default_value>
    <attr_name_3>: list/dict/set = field(default_factory=list/dict/set)

```

- Objects can be made **sortable** with '`order=True`' and immutable with '`frozen=True`'.
- For object to be hashable, all attributes must be hashable and frozen must be True.
- Function `field()` is needed because '`<attr_name>: list = []`' would make a list that is shared among all instances. Its '`default_factory`' argument can be any **callable**.
- For attributes of arbitrary type use '`typing.Any`'.

Inline:

```

from dataclasses import make_dataclass
<class> = make_dataclass('<class_name>', <coll_of_attribute_names>)
<class> = make_dataclass('<class_name>', <coll_of_tuples>)
<tuple> = ('<attr_name>', <type> [, <default_value>])

```

Slots

Mechanism that restricts objects to attributes listed in '`slots`' and significantly reduces their memory footprint.

```

class MyClassWithSlots:
    __slots__ = ['a']

```

```
def __init__(self):  
    self.a = 1
```

Copy

```
from copy import copy, deepcopy  
  
<object> = copy(<object>)  
<object> = deepcopy(<object>)
```

Duck Types

A duck type is an implicit type that prescribes a set of special methods. Any object that has those methods defined is considered a member of that duck type.

Comparable

- If `eq()` method is not overridden, it returns `'id(self) == id(other)'`, which is the same as `'self is other'`.
- That means all objects compare not equal by default.
- Only the left side object has `eq()` method called, unless it returns `NotImplemented`, in which case the right object is consulted.
- `Ne()` automatically works on any object that has `eq()` defined.

```
class MyComparable:  
    def __init__(self, a):  
        self.a = a  
    def __eq__(self, other):  
        if isinstance(other, type(self)):  
            return self.a == other.a  
        return NotImplemented
```

Hashable

- Hashable object needs both `hash()` and `eq()` methods and its hash value should never change.
- Hashable objects that compare equal must have the same hash value, meaning default `hash()` that returns `'id(self)'` will not do.
- That is why Python automatically makes classes unhashable if you only implement `eq()`.

```
class MyHashable:  
    def __init__(self, a):  
        self._a = a  
    @property  
    def a(self):  
        return self._a
```

```
def __eq__(self, other):
    if isinstance(other, type(self)):
        return self.a == other.a
    return NotImplemented
def __hash__(self):
    return hash(self.a)
```

Sortable

- With `total_ordering` decorator, you only need to provide `eq()` and one of `lt()`, `gt()`, `le()` or `ge()` special methods and the rest will be automatically generated.
- Functions `sorted()` and `min()` only require `lt()` method, while `max()` only requires `gt()`. However, it is best to define them all so that confusion doesn't arise in other contexts.
- When two lists, strings or dataclasses are compared, their values get compared in order until a pair of unequal values is found. The comparison of this two values is then returned. The shorter sequence is considered smaller in case of all values being equal.

```
from functools import total_ordering

@total_ordering
class MySortable:
    def __init__(self, a):
        self.a = a
    def __eq__(self, other):
        if isinstance(other, type(self)):
            return self.a == other.a
        return NotImplemented
    def __lt__(self, other):
        if isinstance(other, type(self)):
            return self.a < other.a
        return NotImplemented
```

Iterator

- Any object that has methods `next()` and `iter()` is an iterator.
- `Next()` should return next item or raise `StopIteration`.
- `Iter()` should return 'self'.

```
class Counter:
    def __init__(self):
        self.i = 0
    def __next__(self):
        self.i += 1
        return self.i
    def __iter__(self):
        return self
```

```
>>> counter = Counter()
>>> next(counter), next(counter), next(counter)
(1, 2, 3)
```

Python has many different iterator objects:

- Sequence iterators returned by the `iter()` function, such as `list_iterator` and `set_iterator`.
- Objects returned by the `itertools` module, such as `count`, `repeat` and `cycle`.
- Generators returned by the `generator functions` and `generator expressions`.
- File objects returned by the `open()` function, etc.

Callable

- All functions and classes have a `call()` method, hence are callable.
- When this cheatsheet uses '`<function>`' as an argument, it actually means '`<callable>`'.

```
class Counter:
    def __init__(self):
        self.i = 0
    def __call__(self):
        self.i += 1
        return self.i
```

```
>>> counter = Counter()
>>> counter(), counter(), counter()
(1, 2, 3)
```

Context Manager

- `Enter()` should lock the resources and optionally return an object.
- `Exit()` should release the resources.
- Any exception that happens inside the `with` block is passed to the `exit()` method.
- If it wishes to suppress the exception it must return a true value.

```
class MyOpen:
    def __init__(self, filename):
        self.filename = filename
    def __enter__(self):
        self.file = open(self.filename)
        return self.file
    def __exit__(self, exc_type, exception, traceback):
        self.file.close()
```

```
>>> with open('test.txt', 'w') as file:
...     file.write('Hello World!')
>>> with MyOpen('test.txt') as file:
...     print(file.read())
Hello World!
```

Iterable Duck Types

Iterable

- Only required method is `iter()`. It should return an iterator of object's items.
- `Contains()` automatically works on any object that has `iter()` defined.

```
class MyIterable:
    def __init__(self, a):
        self.a = a
    def __iter__(self):
        return iter(self.a)
    def __contains__(self, el):
        return el in self.a
```

```
>>> obj = MyIterable([1, 2, 3])
>>> [el for el in obj]
[1, 2, 3]
>>> 1 in obj
True
```

Collection

- Only required methods are `iter()` and `len()`.
- This cheatsheet actually means '`<iterable>`' when it uses '`<collection>`'.
- I chose not to use the name 'iterable' because it sounds scarier and more vague than 'collection'. The only drawback of this decision is that a reader could think a certain function doesn't accept iterators when it does, since iterators are the only iterable objects that are not collections.

```
class MyCollection:
    def __init__(self, a):
        self.a = a
    def __iter__(self):
        return iter(self.a)
    def __contains__(self, el):
        return el in self.a
    def __len__(self):
        return len(self.a)
```

Sequence

- Only required methods are `len()` and `getitem()`.
- `Getitem()` should return an item at the passed index or raise `IndexError`.
- `Iter()` and `contains()` automatically work on any object that has `getitem()` defined.
- `Reversed()` automatically works on any object that has `len()` and `getitem()` defined.

```
class MySequence:
    def __init__(self, a):
        self.a = a
    def __iter__(self):
        return iter(self.a)
    def __contains__(self, el):
        return el in self.a
    def __len__(self):
        return len(self.a)
    def __getitem__(self, i):
        return self.a[i]
    def __reversed__(self):
        return reversed(self.a)
```

ABC Sequence

- It's a richer interface than the basic sequence.
- Extending it generates `iter()`, `contains()`, `reversed()`, `index()` and `count()`.
- Unlike `'abc.Iterable'` and `'abc.Collection'`, it is not a duck type. That is why `'issubclass(MySequence, abc.Sequence)'` would return `False` even if `MySequence` had all the methods defined.

```
from collections import abc

class MyAbcSequence(abc.Sequence):
    def __init__(self, a):
        self.a = a
    def __len__(self):
        return len(self.a)
    def __getitem__(self, i):
        return self.a[i]
```

Table of required and automatically available special methods:

	Iterable	Collection	Sequence	abc.Sequence
<code>iter()</code>	REQ	REQ	Yes	Yes

contains()	Yes		Yes		Yes		Yes	
len()			REQ		REQ		REQ	
getitem()					REQ		REQ	
reversed()					Yes		Yes	
index()							Yes	
count()							Yes	
+-----+-----+-----+-----+-----+								

- Other ABCs that generate missing methods are: MutableSequence, Set, MutableSet, Mapping and MutableMapping.
- Names of their required methods are stored in '<abc>.__abstractmethods__'.

Enum

```
from enum import Enum, auto
```

```
class <enum_name>(Enum):
    <member_name_1> = <value_1>
    <member_name_2> = <value_2_a>, <value_2_b>
    <member_name_3> = auto()
```

- If there are no numeric values before auto(), it returns 1.
- Otherwise it returns an increment of the last numeric value.

```
<member> = <enum>.<member_name>           # Returns a member.
<member> = <enum>['<member_name>']         # Returns a member or
raises KeyError.
<member> = <enum>(<value>)                 # Returns a member or
raises ValueError.
<str>     = <member>.name                 # Returns member's name.
<obj>     = <member>.value                # Returns member's value.
```

```
list_of_members = list(<enum>)
member_names    = [a.name for a in <enum>]
member_values   = [a.value for a in <enum>]
random_member   = random.choice(list(<enum>))
```

```
def get_next_member(member):
    members = list(member.__class__)
    index   = (members.index(member) + 1) % len(members)
    return members[index]
```

Inline

```
Cutlery = Enum('Cutlery', 'fork knife spoon')
Cutlery = Enum('Cutlery', ['fork', 'knife', 'spoon'])
Cutlery = Enum('Cutlery', {'fork': 1, 'knife': 2, 'spoon': 3})
```

User-defined functions cannot be values, so they must be wrapped:

```
from functools import partial
LogicOp = Enum('LogicOp', {'AND': partial(lambda l, r: l and r),
                           'OR':  partial(lambda l, r: l or r)})
```

- Member names are in all caps because trying to access a member that is named after a reserved keyword raises `SyntaxError`.

Exceptions

Basic Example

```
try:
    <code>
except <exception>:
    <code>
```

Complex Example

```
try:
    <code_1>
except <exception_a>:
    <code_2_a>
except <exception_b>:
    <code_2_b>
else:
    <code_2_c>
finally:
    <code_3>
```

- Code inside the **'else'** block will only be executed if **'try'** block had no exceptions.
- Code inside the **'finally'** block will always be executed (unless a signal is received).

Catching Exceptions

```
except <exception>:
except <exception> as <name>:
except (<exception>, [...]):
except (<exception>, [...]) as <name>:
```

- Also catches subclasses of the exception.
- Use `'traceback.print_exc()'` to print the error message to stderr.
- Use `'print(<name>)'` to print just the cause of the exception (its arguments).

Raising Exceptions

```
raise <exception>
raise <exception>()
raise <exception>(<el> [, ...])
```

Re-raising caught exception:

```
except <exception> as <name>:
    ...
    raise
```

Exception Object

```
arguments = <name>.args
exc_type = <name>.__class__
filename = <name>.__traceback__.tb_frame.f_code.co_filename
func_name = <name>.__traceback__.tb_frame.f_code.co_name
line = linecache.getline(filename, <name>.__traceback__.tb_lineno)
error_msg = ''.join(traceback.format_exception(exc_type, <name>,
<name>.__traceback__))
```

Built-in Exceptions

BaseException	
+-- SystemExit	# Raised by the sys.exit() function.
+-- KeyboardInterrupt	# Raised when the user hits the
interrupt key (ctrl-c).	
+-- Exception	# User-defined exceptions should be
derived from this class.	
+-- ArithmeticError	# Base class for arithmetic errors.
+-- ZeroDivisionError	# Raised when dividing by zero.
+-- AttributeError	# Raised when an attribute is missing.
+-- EOFError	# Raised by input() when it hits end-of-

```

file condition.
    +-- LookupError                # Raised when a look-up on a collection
fails.
    |    +-- IndexError            # Raised when a sequence index is out of
range.
    |    +-- KeyError              # Raised when a dictionary key or set
element is not found.
    +-- NameError                  # Raised when a variable name is not
found.
    +-- OSError                    # Errors such as "file not found" or
"disk full" (see Open).
    |    +-- FileNotFoundError    # When a file or directory is requested
but doesn't exist.
    +-- RuntimeError                # Raised by errors that don't fall into
other categories.
    |    +-- RecursionError        # Raised when the maximum recursion
depth is exceeded.
    +-- StopIteration              # Raised by next() when run on an empty
iterator.
    +-- TypeError                  # Raised when an argument is of wrong
type.
    +-- ValueError                  # When an argument is of right type but
inappropriate value.
        +-- UnicodeError            # Raised when encoding/decoding strings
to/from bytes fails.

```

Collections and their exceptions:

	List	Set	Dict
getitem()	IndexError		KeyError
pop()	IndexError	KeyError	KeyError
remove()	ValueError	KeyError	
index()	ValueError		

Useful built-in exceptions:

```

raise TypeError('Argument is of wrong type!')
raise ValueError('Argument is of right type but inappropriate value!')
raise RuntimeError('None of above!')

```

User-defined Exceptions

```
class MyError(Exception):  
    pass  
  
class MyInputError(MyError):  
    pass
```

Exit

Exits the interpreter by raising `SystemExit` exception.

```
import sys  
sys.exit()                # Exits with exit code 0 (success).  
sys.exit(<el>)            # Prints to stderr and exits with 1.  
sys.exit(<int>)           # Exits with passed exit code.
```

Print

```
print(<el_1>, ..., sep=' ', end='\n', file=sys.stdout, flush=False)
```

- Use `'file=sys.stderr'` for messages about errors.
- Use `'flush=True'` to forcibly flush the stream.

Pretty Print

```
from pprint import pprint  
pprint(<collection>, width=80, depth=None, compact=False, sort_dicts=True)
```

- Levels deeper than `'depth'` get replaced by `'...'`.

Input

Reads a line from user input or pipe if present.

```
<str> = input(prompt=None)
```

- Trailing newline gets stripped.
- Prompt string is printed to the standard output before reading input.
- Raises `EOFError` when user hits EOF (ctrl-d/ctrl-z↵) or input stream gets exhausted.

Command Line Arguments

```
import sys
scripts_path = sys.argv[0]
arguments    = sys.argv[1:]
```

Argument Parser

```
from argparse import ArgumentParser, FileType
p = ArgumentParser(description=<str>)
p.add_argument('-<short_name>', '--<name>', action='store_true') # Flag
p.add_argument('-<short_name>', '--<name>', type=<type>)          # Option
p.add_argument('<name>', type=<type>, nargs=1)                    # First
argument                                                         #
p.add_argument('<name>', type=<type>, nargs='+')                  #
Remaining arguments                                              #
p.add_argument('<name>', type=<type>, nargs='*')                  #
Optional arguments                                              #
args = p.parse_args()                                           # Exits
on error.
value = args.<name>
```

- Use **'help=<str>'** to set argument description.
- Use **'default=<el>'** to set the default value.
- Use **'type=FileType(<mode>)'** for files.

Open

Opens the file and returns a corresponding file object.

```
<file> = open(<path>, mode='r', encoding=None, newline=None)
```

- **'encoding=None'** means that the default encoding is used, which is platform dependent. Best practice is to use **'encoding="utf-8"'** whenever possible.
- **'newline=None'** means all different end of line combinations are converted to '\n' on read, while on write all '\n' characters are converted to system's default line separator.
- **'newline=""'** means no conversions take place, but input is still broken into chunks by `readline()` and `readlines()` on either '\n', '\r' or '\r\n'.

Modes

- **'r'** - Read (default).
- **'w'** - Write (truncate).
- **'x'** - Write or fail if the file already exists.
- **'a'** - Append.
- **'w+'** - Read and write (truncate).
- **'r+'** - Read and write from the start.

- **'a+'** - Read and write from the end.
- **'t'** - Text mode (default).
- **'b'** - Binary mode.

Exceptions

- **'FileNotFoundError'** can be raised when reading with **'r'** or **'r+'**.
- **'FileExistsError'** can be raised when writing with **'x'**.
- **'IsADirectoryError'** and **'PermissionError'** can be raised by any.
- **'OSError'** is the parent class of all listed exceptions.

File Object

```
<file>.seek(0)                # Moves to the start of the file.
<file>.seek(offset)           # Moves 'offset' chars/bytes from the
start.
<file>.seek(0, 2)              # Moves to the end of the file.
<bin_file>.seek(±offset, <anchor>) # Anchor: 0 start, 1 current position,
2 end.
```

```
<str/bytes> = <file>.read(size=-1) # Reads 'size' chars/bytes or until
EOF.
<str/bytes> = <file>.readline()    # Returns a line or empty string/bytes
on EOF.
<list>      = <file>.readlines()   # Returns a list of remaining lines.
<str/bytes> = next(<file>)         # Returns a line using buffer. Do not
mix.
```

```
<file>.write(<str/bytes>)        # Writes a string or bytes object.
<file>.writelines(<collection>)  # Writes a coll. of strings or bytes
objects.
<file>.flush()                  # Flushes write buffer.
```

- **Methods do not add or strip trailing newlines, even writelines().**

Read Text from File

```
def read_file(filename):
    with open(filename, encoding='utf-8') as file:
        return file.readlines()
```

Write Text to File

```
def write_to_file(filename, text):  
    with open(filename, 'w', encoding='utf-8') as file:  
        file.write(text)
```

Paths

```
from os import getcwd, path, listdir  
from glob import glob
```

```
<str> = getcwd()                # Returns the current working  
directory.  
<str> = path.join(<path>, ...)  # Joins two or more pathname  
components.  
<str> = path.abspath(<path>)    # Returns absolute path.
```

```
<str> = path.basename(<path>)   # Returns final component of the path.  
<str> = path.dirname(<path>)    # Returns path without the final  
component.  
<tuple> = path.splitext(<path>) # Splits on last period of the final  
component.
```

```
<list> = listdir(path='.')      # Returns filenames located at path.  
<list> = glob('<pattern>')      # Returns paths matching the wildcard  
pattern.
```

```
<bool> = path.exists(<path>)    # Or: <Path>.exists()  
<bool> = path.isfile(<path>)    # Or: <DirEntry/Path>.is_file()  
<bool> = path.isdir(<path>)     # Or: <DirEntry/Path>.is_dir()
```

DirEntry

Using `scandir()` instead of `listdir()` can significantly increase the performance of code that also needs file type information.

```
from os import scandir
```

```

<iter> = scandir(path='.')           # Returns DirEntry objects located at
path.                                #
<str>  = <DirEntry>.path              # Returns whole path as a string.
<str>  = <DirEntry>.name              # Returns final component as a string.
<file> = open(<DirEntry>)             # Opens the file and returns file
object.

```

Path Object

```

from pathlib import Path

```

```

<Path> = Path(<path> [, ...])        # Accepts strings, Paths and DirEntry
objects.                             #
<Path> = <path> / <path> [/ ...]     # One of the two paths must be a Path
object.

```

```

<Path> = Path()                      # Returns relative cwd. Also
Path('.').                           #
<Path> = Path.cwd()                  # Returns absolute cwd. Also
Path().resolve().                    #
<Path> = Path.home()                 # Returns user's home directory.
<Path> = Path(__file__).resolve()    # Returns script's path if cwd wasn't
changed.

```

```

<Path> = <Path>.parent                # Returns Path without the final
component.                           #
<str>  = <Path>.name                  # Returns final component as a string.
<str>  = <Path>.stem                  # Returns final component without
extension.                           #
<str>  = <Path>.suffix                 # Returns final component's extension.
<tup.> = <Path>.parts                 # Returns all components as strings.

```

```

<iter> = <Path>.iterdir()              # Returns dir contents as Path
objects.                             #
<iter> = <Path>.glob('<pattern>')      # Returns Paths matching the wildcard
pattern.

```

```

<str>  = str(<Path>)                  # Returns path as a string.
<file> = open(<Path>)                 # Opens the file and returns file

```

```
object.
```

OS Commands

Files and Directories

- **Paths can be either strings, Paths or DirEntry objects.**
- **Functions report OS related errors by raising either OSError or one of its [subclasses](#).**

```
import os, shutil
```

<code>os.chdir(<path>)</code>	# Changes the current working directory.
<code>os.mkdir(<path>, mode=0o777)</code>	# Creates a directory. Mode is in octal.
<code>os.makedirs(<path>, mode=0o777)</code>	# Creates all directories in the path.

<code>shutil.copy(from, to)</code>	# Copies the file. 'to' can exist or be a dir.
<code>shutil.copytree(from, to)</code>	# Copies the directory. 'to' must not exist.

<code>os.rename(from, to)</code>	# Renames/moves the file or directory.
<code>os.replace(from, to)</code>	# Same, but overwrites 'to' if it exists.

<code>os.remove(<path>)</code>	# Deletes the file.
<code>os.rmdir(<path>)</code>	# Deletes the empty directory.
<code>shutil.rmtree(<path>)</code>	# Deletes the directory.

Shell Commands

```
import os
<str> = os.popen('<shell_command>').read()
```

Sends '1 + 1' to the basic calculator and captures its output:

```
>>> from subprocess import run
>>> run('bc', input='1 + 1\n', capture_output=True, text=True)
CompletedProcess(args='bc', returncode=0, stdout='2\n', stderr='')
```

Sends test.in to the basic calculator running in standard mode and saves its output to test.out:

```
>>> from shlex import split
>>> os.popen('echo 1 + 1 > test.in')
>>> run(split('bc -s'), stdin=open('test.in'), stdout=open('test.out',
'w'))
CompletedProcess(args=['bc', '-s'], returncode=0)
>>> open('test.out').read()
'2\n'
```

JSON

Text file format for storing collections of strings and numbers.

```
import json
<str> = json.dumps(<object>, ensure_ascii=True, indent=None)
<object> = json.loads(<str>)
```

Read Object from JSON File

```
def read_json_file(filename):
    with open(filename, encoding='utf-8') as file:
        return json.load(file)
```

Write Object to JSON File

```
def write_to_json_file(filename, an_object):
    with open(filename, 'w', encoding='utf-8') as file:
        json.dump(an_object, file, ensure_ascii=False, indent=2)
```

Pickle

Binary file format for storing objects.

```
import pickle
<bytes> = pickle.dumps(<object>)
<object> = pickle.loads(<bytes>)
```

Read Object from File

```
def read_pickle_file(filename):  
    with open(filename, 'rb') as file:  
        return pickle.load(file)
```

Write Object to File

```
def write_to_pickle_file(filename, an_object):  
    with open(filename, 'wb') as file:  
        pickle.dump(an_object, file)
```

CSV

Text file format for storing spreadsheets.

```
import csv
```

Read

```
<reader> = csv.reader(<file>)          # Also: `dialect='excel',  
delimiter=', '`.  
<list>    = next(<reader>)              # Returns next row as a list of  
strings.  
<list>    = list(<reader>)              # Returns list of remaining rows.
```

- File must be opened with a **'newline=""'** argument, or newlines embedded inside quoted fields will not be interpreted correctly!

Write

```
<writer> = csv.writer(<file>)          # Also: `dialect='excel',  
delimiter=', '`.  
<writer>.writerow(<collection>)        # Encodes objects using `str(<el>)`.  
<writer>.writerows(<coll_of_coll>)    # Appends multiple rows.
```

- File must be opened with a **'newline=""'** argument, or **'\r'** will be added in front of every **'\n'** on platforms that use **'\r\n'** line endings!

Parameters

- **'dialect'** - Master parameter that sets the default values.
- **'delimiter'** - A one-character string used to separate fields.
- **'quotechar'** - Character for quoting fields that contain special characters.
- **'doublequote'** - Whether quotechars inside fields get doubled or escaped.
- **'skipinitialspace'** - Whether whitespace after delimiter gets stripped.
- **'lineterminator'** - Specifies how writer terminates rows.
- **'quoting'** - Controls the amount of quoting: 0 - as necessary, 1 - all.
- **'escapechar'** - Character for escaping quotechars if doublequote is False.

Dialects

	excel	excel-tab	unix
delimiter	','	'\t'	','
quotechar	'\"'	'\"'	'\"'
doublequote	True	True	True
skipinitialspace	False	False	False
lineterminator	'\r\n'	'\r\n'	'\n'
quoting	0	0	1
escapechar	None	None	None

Read Rows from CSV File

```
def read_csv_file(filename):
    with open(filename, encoding='utf-8', newline='') as file:
        return list(csv.reader(file))
```

Write Rows to CSV File

```
def write_to_csv_file(filename, rows):
    with open(filename, 'w', encoding='utf-8', newline='') as file:
        writer = csv.writer(file)
        writer.writerows(rows)
```

SQLite

Server-less database engine that stores each database into a separate file.

Connect

Opens a connection to the database file. Creates a new file if path doesn't exist.

```
import sqlite3
<conn> = sqlite3.connect(<path>)           # Also ':memory:'.
<conn>.close()                             # Closes the connection.
```

Read

Returned values can be of type str, int, float, bytes or None.

```
<cursor> = <conn>.execute('<query>')      # Can raise a subclass of
sqlite3.Error.
<tuple>   = <cursor>.fetchone()           # Returns next row. Also
next(<cursor>).
<list>    = <cursor>.fetchall()           # Returns remaining rows.
Also list(<cursor>).
```

Write

```
<conn>.execute('<query>')                  # Can raise a subclass of
sqlite3.Error.
<conn>.commit()                           # Saves all changes since
the last commit.
<conn>.rollback()                         # Discards all changes
since the last commit.
```

Or:

```
with <conn>:                               # Exits the block with
    commit() or rollback(),
    <conn>.execute('<query>')               # depending on whether any
exception occurred.
```

Placeholders

- Passed values can be of type str, int, float, bytes, None, bool, datetime.date or datetime.datetime.
- Booleans will be stored and returned as ints and dates as [ISO formatted strings](#).

```
<conn>.execute('<query>', <list/tuple>)    # Replaces '?'s in query
with values.
<conn>.execute('<query>', <dict/namedtuple>) # Replaces ':<key>'s with
values.
```

```
<conn>.executemany('<query>', <coll_of_above>) # Runs execute() multiple
times.
```

Example

In this example values are not actually saved because '`conn.commit()`' is omitted!

```
>>> conn = sqlite3.connect('test.db')
>>> conn.execute('CREATE TABLE person (person_id INTEGER PRIMARY KEY,
name, height)')
>>> conn.execute('INSERT INTO person VALUES (NULL, ?, ?)', ('Jean-Luc',
187)).lastrowid
1
>>> conn.execute('SELECT * FROM person').fetchall()
[(1, 'Jean-Luc', 187)]
```

MySQL

Has a very similar interface, with differences listed below.

```
# $ pip3 install mysql-connector
from mysql import connector
<conn> = connector.connect(host=<str>, ...) # `user=<str>, password=
<str>, database=<str>`.
<cursor> = <conn>.cursor() # Only cursor has
execute() method.
<cursor>.execute('<query>') # Can raise a subclass of
connector.Error.
<cursor>.execute('<query>', <list/tuple>) # Replaces '%s's in query
with values.
<cursor>.execute('<query>', <dict/namedtuple>) # Replaces '%(<key>s's
with values.
```

Bytes

Bytes object is an immutable sequence of single bytes. Mutable version is called bytearray.

```
<bytes> = b'<str>' # Only accepts ASCII characters
and \x00-\xff.
<int> = <bytes>[<index>] # Returns int in range from 0 to
255.
<bytes> = <bytes>[<slice>] # Returns bytes even if it has
only one element.
<bytes> = <bytes>.join(<coll_of_bytes>) # Joins elements using bytes as a
separator.
```

Encode

```
<bytes> = bytes(<coll_of_ints>)           # Ints must be in range from 0 to
255.
<bytes> = bytes(<str>, 'utf-8')           # Or: <str>.encode('utf-8')
<bytes> = <int>.to_bytes(n_bytes, ...)    # `byteorder='big/little',
signed=False`.
<bytes> = bytes.fromhex('<hex>')         # Hex pairs can be separated by
spaces.
```

Decode

```
<list>  = list(<bytes>)                   # Returns ints in range from 0 to
255.
<str>   = str(<bytes>, 'utf-8')           # Or: <bytes>.decode('utf-8')
<int>   = int.from_bytes(<bytes>, ...)    # `byteorder='big/little',
signed=False`.
'<hex>' = <bytes>.hex()                   # Returns a string of hexadecimal
pairs.
```

Read Bytes from File

```
def read_bytes(filename):
    with open(filename, 'rb') as file:
        return file.read()
```

Write Bytes to File

```
def write_bytes(filename, bytes_obj):
    with open(filename, 'wb') as file:
        file.write(bytes_obj)
```

Struct

- Module that performs conversions between a sequence of numbers and a bytes object.
- System's type sizes and byte order are used by default.

```
from struct import pack, unpack, iter_unpack
```

```

<bytes>  = pack('<format>', <num_1> [, <num_2>, ...])
<tuple>  = unpack('<format>', <bytes>)
<tuples> = iter_unpack('<format>', <bytes>)

```

Example

```

>>> pack('>hhl', 1, 2, 3)
b'\x00\x01\x00\x02\x00\x00\x00\x03'
>>> unpack('>hhl', b'\x00\x01\x00\x02\x00\x00\x00\x03')
(1, 2, 3)

```

Format

For standard type sizes start format string with:

- '=' - system's byte order (usually little-endian)
- '<' - little-endian
- '>' - big-endian (also '!')

Integer types. Use a capital letter for unsigned type. Minimum and standard sizes are in brackets:

- 'x' - pad byte
- 'b' - char (1/1)
- 'h' - short (2/2)
- 'i' - int (2/4)
- 'l' - long (4/4)
- 'q' - long long (8/8)

Floating point types:

- 'f' - float (4/4)
- 'd' - double (8/8)

Array

List that can only hold numbers of a predefined type. Available types and their minimum sizes in bytes are listed above. Sizes and byte order are always determined by the system.

```

from array import array
<array> = array('<typecode>', <collection>)    # Array from collection of
numbers.
<array> = array('<typecode>', <bytes>)          # Array from bytes object.
<array> = array('<typecode>', <array>)          # Treats array as a
sequence of numbers.
<bytes> = bytes(<array>)                       # Or: <array>.tobytes()

```

```
<file>.write(<array>)           # Writes array to the
binary file.
```

Memory View

- A sequence object that points to the memory of another object.
- Each element can reference a single or multiple consecutive bytes, depending on format.
- Order and number of elements can be changed with slicing.
- Casting only works between char and other types and uses system's sizes and byte order.

```
<mview> = memoryview(<bytes/bytearray/array>) # Immutable if bytes, else
mutable.
<real>  = <mview>[<index>]                     # Returns an int or a
float.
<mview> = <mview>[<slice>]                     # Mview with rearranged
elements.
<mview> = <mview>.cast('<typecode>')           # Casts memoryview to the
new format.
<mview>.release()                             # Releases the object's
memory buffer.
```

Decode

```
<bytes> = bytes(<mview>)                     # Creates a new bytes
object.
<bytes> = <bytes>.join(<coll_of_mviews>)       # Joins mviews using bytes
object as sep.
<array> = array('<typecode>', <mview>)         # Treats mview as a
sequence of numbers.
<file>.write(<mview>)                         # Writes mview to the
binary file.
```

```
<list>  = list(<mview>)                       # Returns list of ints or
floats.
<str>   = str(<mview>, 'utf-8')               # Treats mview as a bytes
object.
<int>   = int.from_bytes(<mview>, ...)        # `byteorder='big/little',
signed=False`.
'<hex>' = <mview>.hex()                       # Treats mview as a bytes
object.
```

Deque

A thread-safe list with efficient appends and pops from either side. Pronounced "deck".

```
from collections import deque
<deque> = deque(<collection>, maxlen=None)
```

```
<deque>.appendleft(<el>)           # Opposite element is
dropped if full.                   # Collection gets reversed.
<deque>.extendleft(<collection>)    # Raises IndexError if
<el> = <deque>.popleft()            # Rotates elements to the
empty.                             right.
<deque>.rotate(n=1)
```

Threading

- CPython interpreter can only run a single thread at a time.
- That is why using multiple threads won't result in a faster execution, unless at least one of the threads contains an I/O operation.

```
from threading import Thread, RLock, Semaphore, Event, Barrier
from concurrent.futures import ThreadPoolExecutor
```

Thread

```
<Thread> = Thread(target=<function>) # Use `args=<collection>`
to set the arguments.                # Starts the thread.
<Thread>.start()                     # Checks if the thread has
<bool> = <Thread>.is_alive()         finished executing.
<Thread>.join()                     # Waits for the thread to
finish.
```

- Use '**kwargs=<dict>**' to pass keyword arguments to the function.
- Use '**daemon=True**', or the program will not be able to exit while the thread is alive.

Lock

```
<lock> = RLock()                    # Lock that can only be
released by the owner.              # Waits for the lock to be
<lock>.acquire()                     available.
<lock>.release()                     # Makes the lock available
again.
```

Or:

```
with <lock>:                                # Enters the block by
    calling acquire(),
    ...                                     # and exits it with
    release().
```

Semaphore, Event, Barrier

```
<Semaphore> = Semaphore(value=1)           # Lock that can be acquired
by 'value' threads.
<Event>      = Event()                     # Method wait() blocks
until set() is called.
<Barrier>    = Barrier(n_times)            # Wait() blocks until it's
called n_times.
```

Thread Pool Executor

Object that manages thread execution.

```
<Exec> = ThreadPoolExecutor(max_workers=None) # Or: `with
ThreadPoolExecutor() as <name>: ...`
<Exec>.shutdown(wait=True)                  # Blocks until all threads
finish executing.
```

```
<iter> = <Exec>.map(<func>, <args_1>, ...)   # A multithreaded and non-
lazy map().
<Futr> = <Exec>.submit(<func>, <arg_1>, ...) # Starts a thread and
returns its Future object.
<bool> = <Futr>.done()                      # Checks if the thread has
finished executing.
<obj>  = <Futr>.result()                    # Waits for thread to
finish and returns result.
```

Queue

A thread-safe FIFO queue. For LIFO queue use LifoQueue.

```
from queue import Queue
<Queue> = Queue(maxsize=0)
```

```

<Queue>.put(<el>)                # Blocks until queue stops
being full.
<Queue>.put_nowait(<el>)          # Raises queue.Full
exception if full.
<el> = <Queue>.get()              # Blocks until queue stops
being empty.
<el> = <Queue>.get_nowait()        # Raises queue.Empty
exception if empty.

```

Operator

Module of functions that provide the functionality of operators.

```

from operator import add, sub, mul, truediv, floordiv, mod, pow, neg, abs
from operator import eq, ne, lt, le, gt, ge
from operator import and_, or_, xor, inv
from operator import itemgetter, attrgetter, methodcaller

```

```

import operator as op
elementwise_sum = map(op.add, list_a, list_b)
sorted_by_second = sorted(<collection>, key=op.itemgetter(1))
sorted_by_both = sorted(<collection>, key=op.itemgetter(1, 0))
product_of_elems = functools.reduce(op.mul, <collection>)
union_of_sets = functools.reduce(op.or_, <coll_of_sets>)
last_element = op.methodcaller('pop')(<list>)

```

- Functions `and_()`, `or_()`, `xor()` and `inv()` correspond to operators '&', '|', '^' and '~'.
- They only work on objects with `and()`, `or()`, `xor()` and `invert()` special methods.
- Also: '`<int> = <int> &|^ <bool>`' and '`<bool> = <bool> &|^ <bool>`'.

Introspection

Inspecting code at runtime.

Variables

```

<list> = dir()                    # Names of local variables
(incl. functions).
<dict> = vars()                   # Dict of local variables. Also
locals().
<dict> = globals()               # Dict of global variables.

```

Attributes

```

<list> = dir(<object>)                # Names of object's attributes
(incl. methods).
<dict> = vars(<object>)                # Dict of writable attributes.
Also <obj>.__dict__.
<bool> = hasattr(<object>, '<attr_name>') # Checks if getattr() raises an
AttributeError.
value = getattr(<object>, '<attr_name>') # Raises AttributeError if
attribute is missing.
setattr(<object>, '<attr_name>', value)  # Only works on objects with
'__dict__' attribute.
delattr(<object>, '<attr_name>')         # Same. Also `del <object>.<attr_name>`.

```

Parameters

```

from inspect import signature
<Sig> = signature(<function>)          # Function's Signature object.
<dict> = <Sig>.parameters               # Dict of function's Parameter
objects.
<str> = <Param>.name                    # Parameter's name.
<memb> = <Param>.kind                   # Member of ParameterKind enum.

```

Metaprogramming

Code that generates code.

Type

Type is the root class. If only passed an object it returns its type (class). Otherwise it creates a new class.

```

<class> = type('<class_name>', <tuple_of_parents>,
<dict_of_class_attributes>)

```

```

>>> Z = type('Z', (), {'a': 'abcde', 'b': 12345})
>>> z = Z()

```

Meta Class

A class that creates classes.

```

def my_meta_class(name, parents, attrs):
    attrs['a'] = 'abcde'

```

```
return type(name, parents, attrs)
```

Or:

```
class MyMetaClass(type):
    def __new__(cls, name, parents, attrs):
        attrs['a'] = 'abcde'
        return type.__new__(cls, name, parents, attrs)
```

- **New()** is a class method that gets called before **init()**. If it returns an instance of its class, then that instance gets passed to **init()** as a 'self' argument.
- It receives the same arguments as **init()**, except for the first one that specifies the desired type of the returned instance (**MyMetaClass** in our case).
- Like in our case, **new()** can also be called directly, usually from a **new()** method of a child class (`def __new__(cls): return super().__new__(cls)`).
- The only difference between the examples above is that **my_meta_class()** returns a class of type **type**, while **MyMetaClass()** returns a class of type **MyMetaClass**.

Metaclass Attribute

Right before a class is created it checks if it has the 'metaclass' attribute defined. If not, it recursively checks if any of his parents has it defined and eventually comes to **type()**.

```
class MyClass(metaclass=MyMetaClass):
    b = 12345
```

```
>>> MyClass.a, MyClass.b
('abcde', 12345)
```

Type Diagram

```
type(MyClass)      == MyMetaClass      # MyClass is an instance of
MyMetaClass.
type(MyMetaClass) == type              # MyMetaClass is an instance of type.
```

```
+-----+-----+
|  Classes  | Metaclasses |
+-----+-----+
|  MyClass --> MyMetaClass |
|           |           v |
|  object  -----> type <+ |
```

Inheritance Diagram

```

MyClass.__base__ == object      # MyClass is a subclass of object.
MyMetaClass.__base__ == type   # MyMetaClass is a subclass of type.
  
```

Eval

```

>>> from ast import literal_eval
>>> literal_eval('[1, 2, 3]')
[1, 2, 3]
>>> literal_eval('1 + 2')
ValueError: malformed node or string
  
```

Coroutines

- Coroutines have a lot in common with threads, but unlike threads, they only give up control when they call another coroutine and they don't use as much memory.
- Coroutine definition starts with `'async'` and its call with `'await'`.
- `'asyncio.run(<coroutine>)'` is the main entry point for asynchronous programs.
- Functions `wait()`, `gather()` and `as_completed()` can be used when multiple coroutines need to be started at the same time.
- Asyncio module also provides its own [Queue](#), [Event](#), [Lock](#) and [Semaphore](#) classes.

Runs a terminal game where you control an asterisk that must avoid numbers:

```

import asyncio, collections, curses, enum, random

P = collections.namedtuple('P', 'x y')          # Position
D = enum.Enum('D', 'n e s w')                  # Direction
  
```

```

def main(screen):
    curses.curs_set(0)                # Makes cursor invisible.
    screen.nodelay(True)              # Makes getch() non-
    blocking.                          # Starts running asyncio
    asyncio.run(main_coroutine(screen))

async def main_coroutine(screen):
    state = {'*': P(0, 0), **{id_: P(30, 10) for id_ in range(10)}}
    moves = asyncio.Queue()
    coros = (*(random_controller(id_, moves) for id_ in range(10)),
              human_controller(screen, moves),
              model(moves, state, *screen.getmaxyx()),
              view(state, screen))
    await asyncio.wait(coros, return_when=asyncio.FIRST_COMPLETED)

async def random_controller(id_, moves):
    while True:
        d = random.choice(list(D))
        moves.put_nowait((id_, d))
        await asyncio.sleep(random.random() / 2)

async def human_controller(screen, moves):
    while True:
        ch = screen.getch()
        key_mappings = {259: D.n, 261: D.e, 258: D.s, 260: D.w}
        if ch in key_mappings:
            moves.put_nowait(('*', key_mappings[ch]))
            await asyncio.sleep(0.01)

async def model(moves, state, height, width):
    while state['*'] not in {p for id_, p in state.items() if id_ != '*'}:
        id_, d = await moves.get()
        p = state[id_]
        deltas = {D.n: P(0, -1), D.e: P(1, 0), D.s: P(0, 1), D.w: P(-1,
0)}}
        new_p = P(p.x + deltas[d].x, p.y + deltas[d].y)
        if 0 <= new_p.x < width-1 and 0 <= new_p.y < height:
            state[id_] = new_p

async def view(state, screen):
    while True:
        screen.clear()
        for id_, p in state.items():
            screen.addstr(p.y, p.x, str(id_))
            await asyncio.sleep(0.01)

if __name__ == '__main__':
    curses.wrapper(main)

```

Libraries

Progress Bar

```
# $ pip3 install tqdm
>>> from tqdm import tqdm
>>> from time import sleep
>>> for el in tqdm([1, 2, 3], desc='Processing'):
...     sleep(1)
Processing: 100%|██████████| 3/3 [00:03<00:00, 1.00s/it]
```

Plot

```
# $ pip3 install matplotlib
import matplotlib.pyplot as plt
plt.plot(<x_data>, <y_data> [, label=<str>]) # Or: plt.plot(<y_data>)
plt.legend() # Adds a legend.
plt.savefig(<path>) # Saves the figure.
plt.show() # Displays the figure.
plt.clf() # Clears the figure.
```

Table

Prints a CSV file as an ASCII table:

```
# $ pip3 install tabulate
import csv, tabulate
with open('test.csv', encoding='utf-8', newline='') as file:
    rows = csv.reader(file)
    header = [a.title() for a in next(rows)]
    table = tabulate.tabulate(rows, header)
    print(table)
```

Curses

Runs a basic file explorer in the terminal:

```
from curses import wrapper, ascii, A_REVERSE, KEY_UP, KEY_DOWN, KEY_LEFT,
KEY_RIGHT, KEY_ENTER
from os import listdir, path, chdir

def main(screen):
    ch, first, selected, paths = 0, 0, 0, listdir()
```

```

while ch != ascii.ESC:
    height, _ = screen.getmaxyx()
    screen.clear()
    for y, filename in enumerate(paths[first : first+height]):
        screen.addstr(y, 0, filename, A_REVERSE * (selected == first +
y))

    ch = screen.getch()
    selected += (ch == KEY_DOWN) - (ch == KEY_UP)
    selected = max(0, min(len(paths)-1, selected))
    first += (first <= selected - height) - (first > selected)
    if ch in [KEY_LEFT, KEY_RIGHT, KEY_ENTER, 10, 13]:
        new_dir = '..' if ch == KEY_LEFT else paths[selected]
        if path.isdir(new_dir):
            chdir(new_dir)
            first, selected, paths = 0, 0, listdir()

if __name__ == '__main__':
    wrapper(main)

```

Logging

```

# $ pip3 install loguru
from loguru import logger

```

```

logger.add('debug_{time}.log', colorize=True) # Connects a log file.
logger.add('error_{time}.log', level='ERROR') # Another file for errors
or higher.
logger.<level>('A logging message.')

```

- **Levels:** 'debug', 'info', 'success', 'warning', 'error', 'critical'.

Exceptions

Exception description, stack trace and values of variables are appended automatically.

```

try:
    ...
except <exception>:
    logger.exception('An error happened.')

```

Rotation

Argument that sets a condition when a new log file is created.

```
rotation=<int>|<datetime.timedelta>|<datetime.time>|<str>
```

- '**<int>**' - Max file size in bytes.
- '**<timedelta>**' - Max age of a file.
- '**<time>**' - Time of day.
- '**<str>**' - Any of above as a string: '**100 MB**', '**1 month**', '**monday at 12:00**', ...

Retention

Sets a condition which old log files get deleted.

```
retention=<int>|<datetime.timedelta>|<str>
```

- '**<int>**' - Max number of files.
- '**<timedelta>**' - Max age of a file.
- '**<str>**' - Max age as a string: '**1 week, 3 days**', '**2 months**', ...

Scraping

Scrapes Python's URL, version number and logo from its Wikipedia page:

```
# $ pip3 install requests beautifulsoup4
import requests, bs4, sys

WIKI_URL = 'https://en.wikipedia.org/wiki/Python_(programming_language)'
try:
    html      = requests.get(WIKI_URL).text
    document  = bs4.BeautifulSoup(html, 'html.parser')
    table     = document.find('table', class_='infobox vevent')
    python_url = table.find('th', text='Website').next_sibling.a['href']
    version   = table.find('th', text='Stable
release').next_sibling.strings.__next__()
    logo_url  = table.find('img')['src']
    logo      = requests.get(f'https://{logo_url}').content
    with open('test.png', 'wb') as file:
        file.write(logo)
    print(python_url, version)
except requests.exceptions.ConnectionError:
    print("You've got problems with connection.", file=sys.stderr)
```

Web

```
# $ pip3 install bottle
from bottle import run, route, static_file, template, post, request,
```

```
response
import json
```

Run

```
run(host='localhost', port=8080)      # Runs locally.
run(host='0.0.0.0', port=80)         # Runs globally.
```

Static Request

```
@route('/img/<filename>')
def send_file(filename):
    return static_file(filename, root='img_dir/')
```

Dynamic Request

```
@route('/<sport>')
def send_html(sport):
    return template('<h1>{{title}}</h1>', title=sport)
```

REST Request

```
@post('/<sport>/odds')
def send_json(sport):
    team = request.forms.get('team')
    home_odds, away_odds = 2.44, 3.29
    response.headers['Content-Type'] = 'application/json'
    response.headers['Cache-Control'] = 'no-cache'
    return json.dumps([team, home_odds, away_odds])
```

Test:

```
# $ pip3 install requests
>>> import threading, requests
>>> threading.Thread(target=run, daemon=True).start()
>>> url = 'http://localhost:8080/football/odds'
>>> data = {'team': 'arsenal f.c.'}
>>> response = requests.post(url, data=data)
>>> response.json()
['arsenal f.c.', 2.44, 3.29]
```

Profiling

Stopwatch

```
from time import time
start_time = time()                # Seconds since the Epoch.
...
duration = time() - start_time
```

High performance:

```
from time import perf_counter
start_time = perf_counter()        # Seconds since the restart.
...
duration = perf_counter() - start_time
```

Timing a Snippet

```
>>> from timeit import timeit
>>> timeit("'.join(str(i) for i in range(100))",
...       number=10000, globals=globals(), setup='pass')
0.34986
```

Profiling by Line

```
# $ pip3 install line_profiler memory_profiler
@profile
def main():
    a = [*range(10000)]
    b = {*range(10000)}
main()
```

```
$ kernprof -lv test.py
Line #    Hits      Time    Per Hit   % Time  Line Contents
=====
      1                @profile
      2                def main():
      3             1     955.0      955.0     43.7      a = [*range(10000)]
      4             1    1231.0     1231.0     56.3      b = {*range(10000)}
```

```
$ python3 -m memory_profiler test.py
```

Line #	Mem usage	Increment	Line Contents
1	37.668 MiB	37.668 MiB	@profile
2			def main():
3	38.012 MiB	0.344 MiB	a = [*range(10000)]
4	38.477 MiB	0.465 MiB	b = {*range(10000)}

Call Graph

Generates a PNG image of the call graph with highlighted bottlenecks:

```
# $ pip3 install pycallgraph2
from pycallgraph2 import output, PyCallGraph
from datetime import datetime
filename = f'profile-{datetime.now():%Y%m%d%H%M%S}.png'
drawer = output.GraphvizOutput(output_file=filename)
with PyCallGraph(drawer):
    <code_to_be_profiled>
```

NumPy

Array manipulation mini-language. It can run up to one hundred times faster than the equivalent Python code. An even faster alternative that runs on a GPU is called CuPy.

```
# $ pip3 install numpy
import numpy as np
```

```
<array> = np.array(<list>)
<array> = np.arange(from_inclusive, to_exclusive, ±step_size)
<array> = np.ones(<shape>)
<array> = np.random.randint(from_inclusive, to_exclusive, <shape>)
```

```
<array>.shape = <shape>
<view>  = <array>.reshape(<shape>)
<view>  = np.broadcast_to(<array>, <shape>)
```

```
<array> = <array>.sum(axis)
indexes = <array>.argmin(axis)
```

- **Shape is a tuple of dimension sizes.**
- **Axis is an index of the dimension that gets collapsed. Leftmost dimension has index 0.**

Indexing

```
<el>          = <2d_array>[row_index, column_index]
<1d_view>     = <2d_array>[row_index]
<1d_view>     = <2d_array>[:, column_index]
```

```
<1d_array> = <2d_array>[row_indexes, column_indexes]
<2d_array> = <2d_array>[row_indexes]
<2d_array> = <2d_array>[:, column_indexes]
```

```
<2d_bools> = <2d_array> > <el>
<1d_array> = <2d_array>[<2d_bools>]
```

Broadcasting

Broadcasting is a set of rules by which NumPy functions operate on arrays of different sizes and/or dimensions.

```
left  = [[0.1], [0.6], [0.8]]      # Shape: (3, 1)
right = [ 0.1 ,  0.6 ,  0.8 ]      # Shape: (3)
```

1. If array shapes differ in length, left-pad the shorter shape with ones:

```
left  = [[0.1], [0.6], [0.8]]      # Shape: (3, 1)
right = [[0.1 ,  0.6 ,  0.8]]      # Shape: (1, 3) <- !
```

2. If any dimensions differ in size, expand the ones that have size 1 by duplicating their elements:

```
left  = [[0.1, 0.1, 0.1], [0.6, 0.6, 0.6], [0.8, 0.8, 0.8]] # Shape: (3, 3) <- !
right = [[0.1, 0.6, 0.8], [0.1, 0.6, 0.8], [0.1, 0.6, 0.8]] # Shape: (3, 3) <- !
```

3. If neither non-matching dimension has size 1, raise an error.

Example

For each point returns index of its nearest point ([0.1, 0.6, 0.8] => [1, 2, 1]):

```
>>> points = np.array([0.1, 0.6, 0.8])
[ 0.1,  0.6,  0.8]
>>> wrapped_points = points.reshape(3, 1)
[[ 0.1],
 [ 0.6],
 [ 0.8]]
>>> distances = wrapped_points - points
[[ 0. , -0.5, -0.7],
 [ 0.5,  0. , -0.2],
 [ 0.7,  0.2,  0. ]]
>>> distances = np.abs(distances)
[[ 0. ,  0.5,  0.7],
 [ 0.5,  0. ,  0.2],
 [ 0.7,  0.2,  0. ]]
>>> i = np.arange(3)
[0, 1, 2]
>>> distances[i, i] = np.inf
[[ inf,  0.5,  0.7],
 [ 0.5,  inf,  0.2],
 [ 0.7,  0.2,  inf]]
>>> distances.argmin(1)
[1, 2, 1]
```

Image

```
# $ pip3 install pillow
from PIL import Image
```

```
<Image> = Image.new('<mode>', (width, height)) # Also: `color=
<int/tuple/str>`.
<Image> = Image.open(<path>) # Identifies format based
on file contents.
<Image> = <Image>.convert('<mode>') # Converts image to the
new mode.
<Image>.save(<path>) # Selects format based on
the path extension.
<Image>.show() # Opens image in default
preview app.
```

```
<int/tuple> = <Image>.getpixel((x, y)) # Returns a pixel.
<Image>.putpixel((x, y), <int/tuple>) # Writes a pixel to the
```

```

image.
<ImagingCore> = <Image>.getdata()           # Returns a sequence of
pixels.
<Image>.putdata(<list/ImagingCore>)          # Writes a sequence of
pixels.
<Image>.paste(<Image>, (x, y))                # Writes an image to the
image.

```

```

<2d_array> = np.array(<Image_L>)              # Creates NumPy array from
greyscale image.
<3d_array> = np.array(<Image_RGB>)            # Creates NumPy array from
color image.
<Image>     = Image.fromarray(<array>)        # Creates image from NumPy
array of floats.

```

Modes

- **'1'** - 1-bit pixels, black and white, stored with one pixel per byte.
- **'L'** - 8-bit pixels, greyscale.
- **'RGB'** - 3x8-bit pixels, true color.
- **'RGBA'** - 4x8-bit pixels, true color with transparency mask.
- **'HSV'** - 3x8-bit pixels, Hue, Saturation, Value color space.

Examples

Creates a PNG image of a rainbow gradient:

```

WIDTH, HEIGHT = 100, 100
n_pixels = WIDTH * HEIGHT
hues = (255 * i/n_pixels for i in range(n_pixels))
img = Image.new('HSV', (WIDTH, HEIGHT))
img.putdata([(int(h), 255, 255) for h in hues])
img.convert('RGB').save('test.png')

```

Adds noise to a PNG image:

```

from random import randint
add_noise = lambda value: max(0, min(255, value + randint(-20, 20)))
img = Image.open('test.png').convert('HSV')
img.putdata([(add_noise(h), s, v) for h, s, v in img.getdata()])
img.convert('RGB').save('test.png')

```

Image Draw

```
from PIL import ImageDraw
<ImageDraw> = ImageDraw.Draw(<Image>)
```

```
<ImageDraw>.point((x, y))
<ImageDraw>.line((x1, y1, x2, y2 [, ...]))
<ImageDraw>.arc((x1, y1, x2, y2), from_deg, to_deg)
<ImageDraw>.rectangle((x1, y1, x2, y2))
<ImageDraw>.polygon((x1, y1, x2, y2 [, ...]))
<ImageDraw>.ellipse((x1, y1, x2, y2))
```

- Use '**fill=<color>**' to set the primary color.
- Use '**width=<int>**' to set the width of lines or contours.
- Use '**outline=<color>**' to set the color of the contours.
- Colors can be specified as an int, tuple, '**#rrggbb[aa]**' string or a color name.

Animation

Creates a GIF of a bouncing ball:

```
# $ pip3 install imageio
from PIL import Image, ImageDraw
import imageio
WIDTH, R = 126, 10
frames = []
for velocity in range(1, 16):
    y = sum(range(velocity))
    frame = Image.new('L', (WIDTH, WIDTH))
    draw = ImageDraw.Draw(frame)
    draw.ellipse((WIDTH/2-R, y, WIDTH/2+R, y+R*2), fill='white')
    frames.append(frame)
frames += reversed(frames[1:-1])
imageio.mimsave('test.gif', frames, duration=0.03)
```

Audio

```
import wave
```

<Wave_read>	= wave.open('<path>', 'rb')	# Opens the WAV file.
framerate	= <Wave_read>.getframerate()	# Number of frames per second.
nchannels	= <Wave_read>.getnchannels()	# Number of samples per frame.
sampwidth	= <Wave_read>.getsampwidth()	# Sample size in bytes.

```

nframes      = <Wave_read>.getnframes()      # Number of frames.
<params>     = <Wave_read>.getparams()       # Immutable collection of
above.
<bytes>      = <Wave_read>.readframes(nframes) # Returns next 'nframes'
frames.

```

```

<Wave_write> = wave.open('<path>', 'wb')      # Truncates existing file.
<Wave_write>.setframerate(<int>)             # 44100 for CD, 48000 for
video.
<Wave_write>.setnchannels(<int>)             # 1 for mono, 2 for
stereo.
<Wave_write>.setsampwidth(<int>)             # 2 for CD quality sound.
<Wave_write>.setparams(<params>)             # Sets all parameters.
<Wave_write>.writeframes(<bytes>)            # Appends frames to the
file.

```

- Bytes object contains a sequence of frames, each consisting of one or more samples.
- In a stereo signal, the first sample of a frame belongs to the left channel.
- Each sample consists of one or more bytes that, when converted to an integer, indicate the displacement of a speaker membrane at a given moment.
- If sample width is one byte, then the integer should be encoded unsigned.
- For all other sizes, the integer should be encoded signed with little-endian byte order.

Sample Values

sampwidth	min	zero	max
1	0	128	255
2	-32768	0	32767
3	-8388608	0	8388607
4	-2147483648	0	2147483647

Read Float Samples from WAV File

```

def read_wav_file(filename):
    def get_int(bytes_obj):
        an_int = int.from_bytes(bytes_obj, 'little', signed=sampwidth!=1)
        return an_int - 128 * (sampwidth == 1)
    with wave.open(filename, 'rb') as file:
        sampwidth = file.getsampwidth()
        frames = file.readframes(-1)
        bytes_samples = (frames[i : i+sampwidth] for i in range(0,
len(frames), sampwidth))
        return [get_int(b) / pow(2, sampwidth * 8 - 1) for b in bytes_samples]

```

Write Float Samples to WAV File

```
def write_to_wav_file(filename, float_samples, nchannels=1, sampwidth=2,
    framerate=44100):
    def get_bytes(a_float):
        a_float = max(-1, min(1 - 2e-16, a_float))
        a_float += sampwidth == 1
        a_float *= pow(2, sampwidth * 8 - 1)
        return int(a_float).to_bytes(sampwidth, 'little',
signed=sampwidth!=1)
    with wave.open(filename, 'wb') as file:
        file.setnchannels(nchannels)
        file.setsampwidth(sampwidth)
        file.setframerate(framerate)
        file.writeframes(b''.join(get_bytes(f) for f in float_samples))
```

Examples

Saves a sine wave to a mono WAV file:

```
from math import pi, sin
samples_f = (sin(i * 2 * pi * 440 / 44100) for i in range(100000))
write_to_wav_file('test.wav', samples_f)
```

Adds noise to a mono WAV file:

```
from random import random
add_noise = lambda value: value + (random() - 0.5) * 0.03
samples_f = (add_noise(f) for f in read_wav_file('test.wav'))
write_to_wav_file('test.wav', samples_f)
```

Plays a WAV file:

```
# $ pip3 install simpleaudio
from simpleaudio import play_buffer
with wave.open('test.wav', 'rb') as file:
    p = file.getparams()
    frames = file.readframes(-1)
    play_buffer(frames, p.nchannels, p.sampwidth, p.framerate)
```

Text to Speech

```
# $ pip3 install pyttsx3
import pyttsx3
engine = pyttsx3.init()
engine.say('Sally sells seashells by the seashore.')
engine.runAndWait()
```

Synthesizer

Plays Popcorn by Gershon Kingsley:

```
# $ pip3 install simpleaudio
import math, struct, simpleaudio
from itertools import repeat, chain
F = 44100
P1 = '71J,69J,,71J,66J,,62J,66J,,59J,, '
P2 =
'71J,73J,,74J,73J,,74J,,71J,,73J,71J,,73J,,69J,,71J,69J,,71J,,67J,,71J,, '
get_pause = lambda seconds: repeat(0, int(seconds * F))
sin_f = lambda i, hz: math.sin(i * 2 * math.pi * hz / F)
get_wave = lambda hz, seconds: (sin_f(i, hz) for i in range(int(seconds * F)))
get_hz = lambda key: 8.176 * 2 ** (int(key) / 12)
parse_note = lambda note: (get_hz(note[:2]), 1/4 if 'J' in note else 1/8)
get_samples = lambda note: get_wave(*parse_note(note)) if note else
get_pause(1/8)
samples_f = chain.from_iterable(get_samples(n) for n in f'{P1},{P1},
{P2}'.split(','))
samples_b = b''.join(struct.pack('<h', int(f * 30000)) for f in
samples_f)
simpleaudio.play_buffer(samples_b, 1, 2, F)
```

Pygame

Basic Example

```
# $ pip3 install pygame
import pygame as pg
pg.init()
screen = pg.display.set_mode((500, 500))
rect = pg.Rect(240, 240, 20, 20)
while all(event.type != pg.QUIT for event in pg.event.get()):
    deltas = {pg.K_UP: (0, -1), pg.K_RIGHT: (1, 0), pg.K_DOWN: (0, 1),
pg.K_LEFT: (-1, 0)}
    for key_code, is_pressed in enumerate(pg.key.get_pressed()):
        rect = rect.move(deltas[key_code]) if key_code in deltas and
is_pressed else rect
    screen.fill((0, 0, 0))
```

```
pg.draw.rect(screen, (255, 255, 255), rect)
pg.display.flip()
```

Rectangle

Object for storing rectangular coordinates.

```
<Rect> = pg.Rect(x, y, width, height)          # Floats get truncated
into ints.                                     # Top, right, bottom,
<int>   = <Rect>.x/y/centerx/centery/...       left. Allows assignments.
<tuple> = <Rect>.topleft/center/...            # Topleft, bottomright,
bottomleft. Same.                             # Use move_ip() to move
<Rect> = <Rect>.move((x, y))                   in-place.
```

```
<bool> = <Rect>.collidepoint((x, y))           # Checks if rectangle
contains a point.                             # Checks if two rectangles
<bool> = <Rect>.colliderect(<Rect>)             overlap.
<int>   = <Rect>.collidelist(<list_of_Rect>)    # Returns index of first
colliding Rect or -1.                         # Returns indexes of all
<list> = <Rect>.collidelistall(<list_of_Rect>) colliding Rects.
```

Surface

Object for representing images.

```
<Surf> = pg.display.set_mode((width, height)) # Returns display surface.
<Surf> = pg.Surface((width, height), flags=0) # New RGB surface. RGBA if
`flags=pg.SRCALPHA`.                          # Loads the image. Format
<Surf> = pg.image.load('<path>')               depends on source.
<Surf> = <Surf>.subsurface(<Rect>)            # Returns a subsurface.
```

```
<Surf>.fill(color)                            # Tuple,
Color('#rrggbb[aa]') or Color(<name>).         # Updates pixel.
<Surf>.set_at((x, y), color)                   # Draws passed surface to
<Surf>.blit(<Surf>, (x, y))                    the surface.
```

```

from pygame.transform import scale, ...
<Surf> = scale(<Surf>, (width, height)) # Returns scaled surface.
<Surf> = rotate(<Surf>, degrees)        # Returns rotated and
scaled surface.
<Surf> = flip(<Surf>, x_bool, y_bool)    # Returns flipped surface.

```

```

from pygame.draw import line, ...
line(<Surf>, color, (x1, y1), (x2, y2), width) # Draws a line to the
surface.
arc(<Surf>, color, <Rect>, from_rad, to_rad)    # Also: ellipse(<Surf>,
color, <Rect>)
rect(<Surf>, color, <Rect>)                   # Also: polygon(<Surf>,
color, points)

```

Font

```

<Font> = pg.font.SysFont('<name>', size)      # Loads the system font or
default if missing.
<Font> = pg.font.Font('<path>', size)        # Loads the TTF file. Pass
None for default.
<Surf> = <Font>.render(text, antialias, color) # Background color can be
specified at the end.

```

Sound

```

<Sound> = pg.mixer.Sound('<path>')           # Loads the WAV file.
<Sound>.play()                             # Starts playing the
sound.

```

Basic Mario Brothers Example

```

import collections, dataclasses, enum, io, itertools as it, pygame as pg,
urllib.request
from random import randint

P = collections.namedtuple('P', 'x y')      # Position
D = enum.Enum('D', 'n e s w')              # Direction
SIZE, MAX_SPEED = 50, P(5, 10)             # Screen size, Speed limit

def main():
    def get_screen():
        pg.init()
        return pg.display.set_mode((SIZE*16, SIZE*16))

```

```

def get_images():

19], rect)
    pg.display.flip()

if __name__ == '__main__':
    main()

```

Pandas

```

# $ pip3 install pandas
import pandas as pd
from pandas import Series, DataFrame

```

Series

Ordered dictionary with a name.

```

>>> Series([1, 2], index=['x', 'y'], name='a')
x      1
y      2
Name: a, dtype: int64

```

```

<Sr> = Series(<list>)                # Assigns RangeIndex
starting at 0.
<Sr> = Series(<dict>)                # Takes dictionary's keys
for index.
<Sr> = Series(<dict/Series>, index=<list>) # Only keeps items with keys
specified in index.

```

```

<el> = <Sr>.loc[key]                # Or: <Sr>.iloc[index]
<Sr> = <Sr>.loc[keys]                # Or: <Sr>.iloc[indexes]
<Sr> = <Sr>.loc[from_key : to_key_inclusive] # Or: <Sr>.iloc[from_i :
to_i_exclusive]

```

```

<el> = <Sr>[key/index]                # Or: <Sr>.key
<Sr> = <Sr>[keys/indexes]            # Or: <Sr>
[<key_range/range>]
<Sr> = <Sr>[bools]                  # Or: <Sr>.i/loc[bools]

```

```

<Sr> = <Sr> >== <el/Sr>              # Returns a Series of bools.
<Sr> = <Sr> +-* / <el/Sr>           # Items with non-matching
keys get value NaN.

```

```

<Sr> = <Sr>.append(<Sr>)              # Or:
pd.concat(<coll_of_Sr>)
<Sr> = <Sr>.combine_first(<Sr>)       # Adds items that are not
yet present.
<Sr>.update(<Sr>)                    # Updates items that are
already present.

```

Aggregate, Transform, Map:

```

<el> = <Sr>.sum/max/mean/idxmax/all() # Or:
<Sr>.aggregate(<agg_func>)
<Sr> = <Sr>.rank/diff/cumsum/ffill/interpl() # Or:
<Sr>.agg/transform(<trans_func>)
<Sr> = <Sr>.fillna(<el>)              # Or:
<Sr>.apply/agg/transform/map(<map_func>)

```

- The way '**aggregate()**' and '**transform()**' find out whether the passed function accepts an element or the whole Series is by passing it a single value at first and if it raises an error, then they pass it the whole Series.

```

>>> sr = Series([1, 2], index=['x', 'y'])
x    1
y    2

```

	'sum'	['sum']	{'s': 'sum'}
sr.apply(...)	3	sum 3	s 3
sr.agg(...)			

	'rank'	['rank']	{'r': 'rank'}
sr.apply(...)		rank	
sr.agg(...)	x 1	x 1	r x 1
sr.trans(...)	y 2	y 2	y 2

- Last result has a hierarchical index. Use '<Sr>[key_1, key_2]' to get its values.

DataFrame

Table with labeled rows and columns.

```
>>> DataFrame([[1, 2], [3, 4]], index=['a', 'b'], columns=['x', 'y'])
   x  y
a  1  2
b  3  4
```

```
<DF>    = DataFrame(<list_of_rows>)           # Rows can be either lists,
dicts or series.
<DF>    = DataFrame(<dict_of_columns>)         # Columns can be either
lists, dicts or series.
```

```
<el>     = <DF>.loc[row_key, column_key]       # Or: <DF>.iloc[row_index,
column_index]
<Sr/DF> = <DF>.loc[row_key/s]                 # Or:
<DF>.iloc[row_index/es]
<Sr/DF> = <DF>.loc[:, column_key/s]           # Or: <DF>.iloc[:,
column_index/es]
<DF>     = <DF>.loc[row_bools, column_bools]  # Or: <DF>.iloc[row_bools,
column_bools]
```

```

<Sr/DF> = <DF>[column_key/s]          # Or: <DF>.column_key
<DF>     = <DF>[row_bools]             # Keeps rows as specified by
bools.
<DF>     = <DF>[<DF_of_bools>]         # Assigns NaN to False
values.

```

```

<DF>     = <DF> >== <el/Sr/DF>         # Returns DF of bools. Sr is
treated as a row.
<DF>     = <DF> +-*/ <el/Sr/DF>       # Items with non-matching
keys get value NaN.

```

```

<DF>     = <DF>.set_index(column_key)   # Replaces row keys with
values from a column.
<DF>     = <DF>.reset_index()           # Moves row keys to a column
named index.
<DF>     = <DF>.sort_index(ascending=True) # Sorts rows by row keys.
<DF>     = <DF>.sort_values(column_key/s) # Sorts rows by the passed
column/s.

```

Merge, Join, Concat:

```

>>> l = DataFrame([[1, 2], [3, 4]], index=['a', 'b'], columns=['x', 'y'])
   x  y
a  1  2
b  3  4
>>> r = DataFrame([[4, 5], [6, 7]], index=['b', 'c'], columns=['y', 'z'])
   y  z
b  4  5
c  6  7

```

Description	'outer'	'inner'	'left'	
l.merge(r, on='y', Joins/merges on column. how=...) accepts left_on and right_on parameters.	<pre> 0 1 2 . 1 3 4 5 2 . 6 7 </pre>	<pre> 3 4 5 </pre>	<pre> 1 2 . 3 4 5 </pre>	<pre> Also Uses </pre>

```

'inner' by default. |
+-----+-----+-----+-----+
-----+
| l.join(r, lsuffix='l', | x yl yr z | | x yl yr z |
Joins/merges on row keys. |
| rsuffix='r', | a 1 2 . . | x yl yr z | 1 2 . . | Uses
'left' by default. |
| how=...) | b 3 4 4 5 | 3 4 4 5 | 3 4 4 5 | If r
is a series, it is |
| | c . . 6 7 | | |
treated as a column. |
+-----+-----+-----+-----+
-----+
| pd.concat([l, r], | x y z | y | | Adds
rows at the bottom. |
| axis=0, | a 1 2 . | 2 | | Uses
'outer' by default. |
| join=...) | b 3 4 . | 4 | | A
series is treated as a |
| | b . 4 5 | 4 | |
column. Use l.append(sr) |
| | c . 6 7 | 6 | | to
add a row instead. |
+-----+-----+-----+-----+
-----+
| pd.concat([l, r], | x y y z | | | Adds
columns at the |
| axis=1, | a 1 2 . . | x y y z | | right
end. Uses 'outer' |
| join=...) | b 3 4 4 5 | 3 4 4 5 | | by
default. A series is |
| | c . . 6 7 | | |
treated as a column. |
+-----+-----+-----+-----+
-----+
| l.combine_first(r) | x y z | | | Adds
missing rows and |
| | a 1 2 . | | |
columns. Also updates |
| | b 3 4 5 | | | items
that contain NaN. |
| | c . 6 7 | | | R
must be a DataFrame. |
+-----+-----+-----+-----+
-----+

```

Aggregate, Transform, Map:

```

<Sr> = <DF>.sum/max/mean/idxmax/all()      # Or:
<DF>.apply/agg/transform(<agg_func>)
<DF> = <DF>.rank/diff/cumsum/ffill/interpl() # Or:

```

```
<DF>.apply/agg/transform(<trans_func>)
<DF> = <DF>.fillna(<el>) # Or:
<DF>.applymap(<map_func>)
```

- All operations operate on columns by default. Use '**axis=1**' parameter to process the rows instead.

```
>>> df = DataFrame([[1, 2], [3, 4]], index=['a', 'b'], columns=['x', 'y'])
      x  y
a     1  2
b     3  4
```

	'sum'	['sum']	{'x': 'sum'}
df.apply(...)		x y	
df.agg(...)	x 4 y 6	sum 4 6	x 4

	'rank'	['rank']	{'x': 'rank'}
df.apply(...)	x y	x y	x
df.agg(...)	a 1 1	rank rank	a 1
df.trans(...)	b 2 2	a 1 1 b 2 2	b 2

- Use '**<DF>[col_key_1, col_key_2][row_key]**' to get the fifth result's values.

Encode, Decode:

```
<DF> = pd.read_json/html('<str/path/url>')
<DF> = pd.read_csv/pickle/excel('<path/url>')
<DF> = pd.read_sql('<table_name/query>', <connection>)
<DF> = pd.read_clipboard()
```

```
<dict> = <DF>.to_dict(['d/l/s/sp/r/i'])
<str> = <DF>.to_json/html/csv/markdown/latex([<path>])
<DF>.to_pickle/excel(<path>)
<DF>.to_sql('<table_name>', <connection>)
```

GroupBy

Object that groups together rows of a dataframe based on the value of the passed column.

```
>>> df = DataFrame([[1, 2, 3], [4, 5, 6], [7, 8, 6]], index=list('abc'),
columns=list('xyz'))
>>> df.groupby('z').get_group(3)
   x  y
a  1  2
>>> df.groupby('z').get_group(6)
   x  y
b  4  5
c  7  8
```

```
<GB> = <DF>.groupby(column_key/s)           # DF is split into groups
based on passed column.
<DF> = <GB>.get_group(group_key/s)          # Selects a group by value
of grouping column.
```

Aggregate, Transform, Map:

```
<DF> = <GB>.sum/max/mean/idxmax/all()      # Or:
<GB>.apply/agg(<agg_func>)
<DF> = <GB>.rank/diff/cumsum/ffill()        # Or:
<GB>.aggregate(<trans_func>)
<DF> = <GB>.fillna(<el>)                    # Or:
<GB>.transform(<map_func>)
```

```
>>> gb = df.groupby('z')
   x  y  z
3: a  1  2  3
6: b  4  5  6
   c  7  8  6
```

	'sum'			'rank'			['rank']		{ 'x': 'rank' }	
gb.agg(...)		x	y		x	y		x		
	z			a	1	1	rank	rank	a	1
	3	1	2	b	1	1	a	1	b	1
	6	11	13	c	2	2	b	1	c	2

					c	2	2
gb.trans(...)	x	y	x	y			
	a	1 2	a	1 1			
	b	11 13	b	1 1			
	c	11 13	c	1 1			

Rolling

Object for rolling window calculations.

```

<R_Sr/R_DF/R_GB> = <Sr/DF/GB>.rolling(window_size) # Also:
`min_periods=None, center=False`.
<R_Sr/R_DF>      = <R_DF/R_GB>[column_key/s]        # Or: <R>.column_key
<Sr/DF/DF>      = <R_Sr/R_DF/R_GB>.sum/max/mean()  # Or:
<R>.apply/agg(<agg_func/str>)

```

Plotly

```

# $ pip3 install plotly kaleido
from plotly.express import line
<Figure> = line(<DF>, x=<col_name>, y=<col_name>) # Or: line(x=
<list>, y=<list>)
<Figure>.update_layout(margin=dict(t=0, r=0, b=0, l=0)) # Or:
paper_bgcolor='rgba(0, 0, 0, 0)'
<Figure>.write_html/json/image('<path>') # Also:
<Figure>.show()

```

Covid deaths by continent:

```

covid = pd.read_csv('https://covid.ourworldindata.org/data/owid-covid-
data.csv',
                    usecols=['iso_code', 'date', 'total_deaths',
                              'population'])
continents =
pd.read_csv('https://gist.githubusercontent.com/stevewithington/20a69c0b6d
2ff'
            '846ea5d35e5fc47f26c/raw/country-and-continent-
codes-list-csv.csv',
            usecols=['Three_Letter_Country_Code',
                      'Continent_Name'])
df = pd.merge(covid, continents, left_on='iso_code',
              right_on='Three_Letter_Country_Code')
df = df.groupby(['Continent_Name', 'date']).sum().reset_index()
df['Total Deaths per Million'] = df.total_deaths * 1e6 / df.population
df = df[df.date > '2020-03-14']
df = df.rename({'date': 'Date', 'Continent_Name': 'Continent'},
              axis='columns')
line(df, x='Date', y='Total Deaths per Million', color='Continent').show()

```

Confirmed covid cases, Dow Jones, Gold, and Bitcoin price:

```

import pandas as pd
import plotly.graph_objects as go

def main():
    display_data(wrangle_data(*scrape_data()))

def scrape_data():
    def scrape_covid():
        url = 'https://covid.ourworldindata.org/data/owid-covid-data.csv'
        df = pd.read_csv(url, usecols=['location', 'date', 'total_cases'])
        return df[df.location == 'World'].set_index('date').total_cases
    def scrape_yahoo(slug):
        url =
f'https://query1.finance.yahoo.com/v7/finance/download/{slug}' + \
        '?'
period1=1579651200&period2=9999999999&interval=1d&events=history'
        df = pd.read_csv(url, usecols=['Date', 'Close'])
        return df.set_index('Date').Close
    out = scrape_covid(), scrape_yahoo('BTC-USD'), scrape_yahoo('GC=F'),
scrape_yahoo('^DJI')
    return map(pd.Series.rename, out, ['Total Cases', 'Bitcoin', 'Gold',
'Tow Jones'])

def wrangle_data(covid, bitcoin, gold, dow):
    df = pd.concat([bitcoin, gold, dow], axis=1) # Joins columns on
dates.
    df = df.sort_index().interpolate() # Sorts by date and
interpolates NaN-s.
    df = df.loc['2020-02-23':] # Discards rows before
'2020-02-23'.
    df = (df / df.iloc[0]) * 100 # Calculates percentages
relative to day 1.
    df = df.join(covid) # Adds column with covid
cases.
    return df.sort_values(df.index[-1], axis=1) # Sorts columns by last
day's value.

```

```
def display_data(df):
    figure = go.Figure()
    for col_name in reversed(df.columns):
        yaxis = 'y1' if col_name == 'Total Cases' else 'y2'
        trace = go.Scatter(x=df.index, y=df[col_name], name=col_name,
yaxis=yaxis)
        figure.add_trace(trace)
    figure.update_layout(
        yaxis1=dict(title='Total Cases', rangemode='tozero'),
        yaxis2=dict(title='%', rangemode='tozero', overlaying='y',
side='right'),
        legend=dict(x=1.1),
        height=450
    ).show()

if __name__ == '__main__':
    main()
```

PySimpleGUI

```
# $ pip3 install PySimpleGUI
import PySimpleGUI as sg
layout = [[sg.Text("What's your name?")], [sg.Input()], [sg.Button('Ok')]]
window = sg.Window('Window Title', layout)
event, values = window.read()
print(f'Hello {values[0]}!' if event == 'Ok' else '')
```

Appendix

Cython

Library that compiles Python code into C.

```
# $ pip3 install cython
import pyximport; pyximport.install()
import <cython_script>
<cython_script>.main()
```

Definitions:

- All '**cdef**' definitions are optional, but they contribute to the speed-up.
- Script needs to be saved with a '**pyx**' extension.

```
cdef <ctype> <var_name> = <el>
cdef <ctype>[n_elements] <var_name> = [<el_1>, <el_2>, ...]
```

```
cdef <ctype/void> <func_name>(<ctype> <arg_name_1>, ...):
```

```
cdef class <class_name>:
    cdef public <ctype> <attr_name>
    def __init__(self, <ctype> <arg_name>):
        self.<attr_name> = <arg_name>
```

```
cdef enum <enum_name>: <member_name_1>, <member_name_2>, ...
```

PyInstaller

```
$ pip3 install pyinstaller
$ pyinstaller script.py # Compiles into
'./dist/script' directory.
$ pyinstaller script.py --onefile # Compiles into
'./dist/script' console app.
$ pyinstaller script.py --windowed # Compiles into
'./dist/script' windowed app.
$ pyinstaller script.py --add-data '<path>:.' # Adds file to the root of
the executable.
```

- File paths need to be updated to `'os.path.join(sys._MEIPASS, <path>).'`.

Basic Script Template

```
#!/usr/bin/env python3
#
# Usage: .py
#

from sys import argv, exit
from collections import defaultdict, namedtuple
from dataclasses import make_dataclass
from enum import Enum
import functools as ft, itertools as it, operator as op, re

def main():
    pass

###
## UTIL
#
